DURING the last few years more books have been written on asthma than on any other medical subject. Though this shows a welcome revival of interest in the subject, it is disappointing to find how little that is really new is added to our knowledge of the pathogenesis or treatment of the disease. Dr. VIKTOR GRIMM, who is already well known as the author of the most complete modern monograph on asthma, has attempted to answer the extremely difficult but very important question, Which climatic factors are of importance for asthmatics?[1] He has analysed the replies received from 600 doctors and asthmatic patients to whom he put the question, and has amplified the results in the light of his experience as physician at Bad Reichenhall and of a review of the ancient and modern literature in all languages. The book is divided into two parts, in which the "climate of the dwelling" and "external climate" are respectively discussed. In the former, sensitization to the stuffing of pillows and other articles of furniture, to animal emanations, and house dust is the most important factor. Dr. Grimm comes to the conclusion that a carefully taken history is more likely to lead to the discovery of the active allergens than the use of skin tests. He emphasizes the remarkable manner in which the allergic state varies with the time of day and the season, with age, menstruation, infections, and diet, and his experience shows that the effect of desensitization is unfortunately only temporary. In discussing external climate Dr. Grimm pays great attention to such factors as temperature, moisture, altitude, wind, and the electrical condition of the air, in addition to the factors dependent on sensitization. The one definite fact which emerges from his observations is the remarkably favourable influence of mountain air. Asthma is almost unknown among the permanent inhabitants of the Engadine and Davos, and quite 90 per cent. of asthmatics rapidly become completely well in the mountains. This does not depend upon the purity of the atmosphere or the absence of emanations to which the individual is sensitive, but upon some profound biochemical change in the individual's blood which is caused by altitude.

In his book on asthma[2] Dr. LUDWIG HOFBAUER of Vienna gives a fairly adequate account of the subject. It is, however, curious to find that he regards the narrowing of the bronchi in the attack and their widening after injection of adrenaline as dependent on vasomotor and not broncho-motor changes, being apparently unaware of the experiments of Brodie and Dixon, which showed that the relief obtained with adrenaline was due to stimulation of the broncho-dilator sympathetic fibres. The chief interest in the book lies in an admirable description of the anatomy and physiology of the nose and bronchi and their bearing on the prevention and treatment of asthma. For many years Dr. Hofbauer has obtained excellent results by means of respiratory exercises, the importance of nasal instead of mouth, and diaphragmatic instead of thoracic breathing being specially emphasized. At the present time, when many physicians are apt to concentrate their attention too much on the sensitization factor, and rhinologists on operative and antiseptic treatment, it is useful to have the value of a quite different and very simple treatment emphasized. Though in other hands it is hardly likely to give such remarkable results, there are few asthmatics who would not benefit by the regular use of Dr. Hofbauer's breathing exercises. His advice to avoid baths and to sleep with the window closed would hardly suit English patients, and his fear of arterio-sclerosis resulting from the frequent use of adrenaline is doubtless due to the gross overdose (1/2 to 1 c.cm.) which he recommends.

PEMPHIGUS.

PEMPHIGUS is essentially one of the "grandes dermatoses," as the French designate the more serious diseases of the skin. The clinical characteristics are so clearly marked and easily recognized that it has attracted the attention of dermatologists from the very beginning. The latest monograph[3] by Professor SABRAZÈS and Dr. TORLAIS, although it cannot be said to solve the problems of etiology and pathology set by this baffling condition, is well worth reading by all who are interested in it. The authors have based their work on seven cases of their own, which are related in detailed exactitude, but perhaps the most valuable part of the monograph is to be found in the discussion of the various views held, and the researches carried out, by other observers. In the pathology of the disease one of the most striking observations mentioned—not perhaps quite new, but certainly not widely recognized—is that the fluid drawn from the typical bullae contains no less than 10 per cent. of protein, a proportion greater than that found in the fluid of cardiac or renal oedema, or even in the actual serum of the blood. The authors have come to the conclusion that the time-honoured classification of pemphigus into the *vulgaris*, *foliaceus*, and *vegetans* groups is quite irrational, inasmuch as these are all variations of the same disease. They go even further than that, for they also include the well-known dermatitis herpetiformis and Brocq's chronic polymorphic dermatitis as members of the pemphigus group. They regard pemphigus as essentially a microbic affection, not necessarily due always to the same microbe, and they are inclined to think that the characteristic bullae owe their formation to some inherent peculiarity of the patient's skin, causing it to react in this particular way. Those patients who are unfortunate enough to possess this peculiarity in the highest degree suffer from the congenital condition known as epidermolysis bullosa; those in whom it is not so pronounced may acquire pemphigus later in life, and in these the vulnerability of the skin is shown by the presence of Nikolsky's sign. This is a fascinating theory, but cannot be accepted without further investigation. It depends on the assumption that Nikolsky's sign is always congenital and that it cannot be acquired.

THE FUNDUS OCULI.

IT is always a pleasure to take note of the work of one who is a pioneer; and when his work is of solid merit, has been compiled with considerable pains and care, and is, in addition, of no small artistic merit, the pleasure becomes correspondingly greater. It is with such feelings that we introduce the volume of *Photographs of the Fundus Oculi*[4] which has been compiled by Dr. BEDELL of New York.

In the ordinary course of events, in order to obtain a pictorial record of changes in the fundus, paintings have to be done by hand—a laborious process, both for the artist and the patient, and, since the surgeon rarely has the ability or the time to attend to the matter himself, frequently attended with results that leave much to be desired from the point of view of scientific accuracy. A process of photography would seem to be the obvious solution of the difficulty, but the adaptation of a technique applicable to the interior of the living eye has been beset with difficulties. The pioneers in this work have been Wolfe, Thorner, Salomonson, Dimmer, and Nordenson; and from these, especially the last, Bedell has drawn his inspiration. The photographs were taken with the Nordenson camera of Zeiss, in which the source of illumination employed is the carbon arc (what effect of discomfort it has upon the patient we are not told). Its use results in the complete destruction of the film at the spots where the light is focused, and hence two circles of white (representing the two carbon poles) appear on each photograph. The effect of this is undoubtedly annoying, but it can only be got rid of at the expense of a blurred image. Colour photography, of course, is out of the question, because of the length of the exposure and the intensity of the light which would be required. In such a photograph all the details of the fundus are rendered very evident. Blood, whether in a vessel or appearing as a haemorrhage, is black, or nearly so; yellow material, as in a fresh exudate, varies with the depth of the mass, the thicker the deposit the whiter it appears; pale yellow becomes lighter on a background of contrast; and white is of varying intensity, depending on the background upon which it is found. In this way details can be reproduced with meticulous exactitude, and not the least valuable result of the method is that the progress of a lesion in the fundus, whether for better or for worse, can be followed by records which permit of no cavil. In addition, the possibility of taking stereoscopic photographs allows of a very accurate perception of depth. Is a disc, for example, cupped, or (what is more important) is the cupping progressive? Is a "mass" in the fundus raised, or (what is more important still) is the "mass" growing? If questions such as these can be answered unhesitatingly, then the method, even despite its obvious complexity and expense, is fully justified. One interesting point the stereoscopic camera in Bedell's hands seems to have brought out is that "holes" at the macula are relatively common without any other ocular injury; moreover, a depressed, dark macula is frequent in certain types of uveitis, in circulatory disturbances, and in spontaneous retinal detachment in addition to the classical form following injury. From the medico-legal standpoint this is of some importance.

To appreciate all the clinical points which these photographs demonstrate it is necessary to consult the atlas itself. Altogether it is a most extensive compilation, unique of its kind in the literature of the world, and likely long to remain so. It contains 95 plates, 324 single photographs, and 272 stereo-photographs, each selected with care to represent some one or other point of interest. It is a monument to the enthusiasm and industry as well as to the clinical acumen of its compiler; and it is of the nature of a triumph for its American publishers.

DELINQUENCY IN TWINS.

VERBRECHEN ALS SCHICKSAL[5] (or delinquency as destiny) is a monograph by Professor JOHANNES LANGE of Munich, dealing with delinquency occurring in twins, in which he endeavours to determine whether heredity or environment is the preponderating causal factor. Identical or uniovular twins are alike in appearance, and the author endeavours to show that their reactions and nervous disorders are likewise similar. In his notes we find instances of two boy twins living some distance apart, who both fell sick at the same time and were operated on for appendicitis, and also of two who were petty swindlers and simultaneously became bald, fat, and diabetic. Finally, the author lays down that, in twins, concordance in life's events is due to similar hereditary factors, whilst discordance implies their absence. From prison records he has collected thirty pairs of twins, thirteen uniovular, and seventeen binovular, one of whom at least in each case had been convicted. In ten cases among the thirteen uniovular twins, the partner had also been convicted (concordance); but among the seventeen binovular twins, this had only happened in two cases, and in these two cases other causal factors were clearly traced, thus reducing the number to fifteen, in which only one of each twin pair had been convicted (discordance). Concentrating his attention on the ten cases of uniovular twins, Professor Lange gives full records, extending over fifty pages, demonstrating their concordance in body and behaviour. The hereditary factor in criminality is suggested from the observation that 77 per cent. concordance occurs in uniovular as against 12 per cent. in binovular twins. The author estimates the other convicted brothers of uniovular twins as about 1 in 4, of binovular as 1 in 8.5, and quotes Viernstein's observations in Straubing prison on the ordinary convicted brothers of prisoners as 1 in 12. He holds that if criminality is a compulsory

matter, the result of laws we cannot withstand, there is no right to punish in the narrow sense. Security of the community is the aim of punishment, although not realized in the means. He advocates improved after-care, and, more pressing still, restriction of alcohol; early recognition of delinquents through better criminal study; and prophylaxis through genetic measures in preventing individuals with active criminal heredity from being born. The Bavarian research is a sound start, but deeper and wider knowledge is needed for its completion.

PREVENTION OF TUBERCULOSIS.

In his book *Some Methods for the Prevention of Tuberculosis*[6] Dr. W. BOLTON TOMSON has assembled and presented, in a manner likely to interest the public administrator no less than the medical practitioner, an account of some of the tuberculosis schemes operating in Europe and America. Holding that many of the schemes built up in England have failed to realize the results anticipated at their inception, and that progress in the eradication of tuberculosis is practically at a standstill, he analyses the general principles underlying methods which have been successful, and suggests how in this country they might be translated into effective action. In the main, the principle animating the chief organizations in France, Belgium, Switzerland, Norway, Sweden, and America has been *dépistage*—namely, the separation of the possible *victim* from the source of *infection*. Of this kind are the Grancher Association, established in France in 1903 for the protection of children against tuberculosis, and the *Placement Familial des Tout-Petits* founded in 1920 to deal from birth with children in danger of contracting the infection. In England, on the other hand, the view underlying many tuberculosis schemes is that it is possible, by raising the bodily resistance against the disease and by diminishing the intensity and size of the infecting dose, to prevent not infection but its consequences. The value of the English view, with its corollary that repeated small doses of infection, far from being harmful, may actually confer immunity, has been demonstrated, Dr. Tomson believes, by the results obtained in our tuberculosis village settlements. In the Papworth Colony, for example, not one of the 140 children born of tuberculous parents since its foundation in 1916 has suffered from any form of tuberculosis, and at Preston Hall a similar record has been established since its reorganization in 1925. The advantage of the settlement to the patient is that he can live a sheltered life, working when he can and resting when he should. The patients, says Dr. Tomson, "are no longer a misery to themselves or a danger to others. They beget children that grow up strong and well, untainted and unaffected by the disease from which their parents suffer." Moreover, as the Papworth records show, a settlement can be made to become self-supporting. Dr. Tomson's conclusion is that, however admirable may be the work of organizations carrying out the principles of *dépistage*, the village settlement, by rendering possible the successful immunization of children born of tuberculous parents, affords the best hope of eradicating the disease.

BACTERIOLOGY.

PROFESSOR DIBLE has accomplished a difficult task in his book *Recent Advances in Bacteriology*.[7] To give a judicial summary of "advances" in any subject is far from easy, but when the subject is one which is still showing a youthful exuberance of growth the task of choice and rejection is particularly difficult. The author has avoided the mistake of giving a mere catalogue of other people's opinions. He has made the story interesting and readable to everyone, even when talking about the streptococci, or the bacteriophage, or B.C.G., or recent laboratory work in connexion with infectious diseases. These are the main subjects dealt with in this volume, and the reader is presented with a very comprehensive account of what has been accomplished in the field of bacteriology during the years from the commencement of the war to the year 1928.

One of the most important points to notice about any book of bacteriology is for whom it is intended. Dr. CURTIS HILLIARD'S *Textbook of Bacteriology and its Applications*[8] is a good account of the general science of bacteriology written for students of science, but not for medical students. Even public health questions such as water and food analysis are not dealt with sufficiently thoroughly for students preparing for the D.P.H.; but for general science students it would be a useful book, well written, accurate, and convenient in size.

NOTES ON BOOKS.

THE *Correct Lines of Dietetic Therapy*,[9] by Professor FRITZ RABE, represents a real attempt to discuss dietetic therapy on sound and scientific lines. In such a work it is, of course, neither possible nor even desirable for the author entirely to avoid controversial ground; when, however, Professor Rabe enters debatable territory his remarks are characterized by moderation and soundness of outlook. This is especially well illustrated in the section dealing with nephritis, which shows evidence of wide knowledge and careful thought. Constipation, the happy hunting ground of the commercial publicist, is dismissed in a few paragraphs. It is unfortunate that there are so few books in English that cover so concisely and effectively a similar range of subject.

In a volume on *The New Psychology of the Unconscious*[10] Dr. C. W. VALENTINE, professor of education in the University of Birmingham, aims to give a concise exposition of his subject, and to indicate what he believes to be fairly well established and what is still speculative theory or hasty generalization in the new teaching. He also aims to bring the main doctrines into line with "orthodox" psychology, and to show how they may be regarded as unfamiliar examples of recognized fundamental laws of the mind. This book is a revision of *Dreams and the Unconscious*, published in 1921.

In *How to Stain the Nervous System*[11] Mr. J. ANDERSON has produced a very useful little book. Descriptions of so many of the more modern methods are scattered through foreign journals that it is quite hopeless, for example, for a junior medical officer in a mental hospital to reach them. This small book gives him all he wants to begin with. It would have been an advantage to have given Dieterle's method of staining spirochaetes in the nervous system, as Jahnel's method takes such a long time to carry through.

The popularity of Dr. A. E. HERTZLER'S monograph on *The Technic of Local Anesthesia*[12] is evidenced by the fact that a fourth edition has been called for within three years of the appearance of the third edition. The aim of the author has been, as he says, not to show what operations can be performed under local anaesthesia, but in what operations it is to be preferred. He exhibits no particular bias towards the particular form of anaesthesia he is describing, and quite readily agrees that in certain patients general anaesthesia would be best. In fact, he approaches each case with an open mind, and prescribes the anaesthetic he considers most suitable just as he would prescribe any other drug; he does not hesitate to use combined local and general anaesthesia where indicated. His descriptions of technique are clear and very readable; they are supported by many well-chosen illustrations beautifully reproduced on paper suitable for this purpose. The book can be confidently recommended to those interested in local anaesthesia.

The twenty-first volume of the *Bulletin of the Ophthalmological Society of Egypt* comprises the proceedings of this society during its twenty-fifth session. Reports are included of the annual meeting in Cairo in March, 1928, and of the International Ophthalmological Conference at Scheveningen, Holland, in July, 1927. Dr. M. A. El Bakly contributes some clinical notes based on a visit to Vienna. Short illustrated articles on ophthalmological subjects compose the bulk of the volume

SUPPLY AND DISTRIBUTION OF RADIUM.

THE SUBCOMMITTEE'S REPORT.

IN last week's issue (p. 736) we were able to give only an outline of the conclusions and recommendations contained in the report of the Radium Subcommittee of the Committee of Civil Research,[1] which was published as we were going to press. We return to the subject this week because we believe that this report, which embodies a detailed account of the existing supply of radium available for medical treatment in Great Britain, a consideration of the possibilities afforded by existing and potential sources of radium production, an estimate of the amount of radium at present required for medical purposes in England, Scotland, and Wales, and a proposed scheme for the purchase and distribution of a central stock of radium for medical purposes, is a document of the deepest concern to the medical profession. Its recommendations, if adopted, will determine the method by which the bulk of the radium used in this country for medical purposes will be bought and administered for many years to come.

Radium in Medical Treatment.

Following a brief account of its procedure during the inquiry, the subcommittee makes a balanced statement of the importance which in recent years radium has acquired in medical practice. With the elaboration of methods for the radium treatment of cancer of almost every region of the body except the stomach, there has occurred a transformation of the modes adopted for its application, above all in regard to the time of exposure, the quantity of radium to be employed, the position to be selected for it, and the so-called surgery of access. The subcommittee reaffirms the view now generally held that radium will, in increasing measure, replace excisional surgery in the treatment of cancer, and that already cancer of the uterus may be treated as effectively with radium as by operation. The amount of radium now available, though greater than it was in 1926, is still inadequate to cope even with the most pressing needs. There exists, moreover, a lamentable shortage of highly trained radium surgeons, and a corresponding shortage of available hospital beds. Remedy of these deficiencies, the subcommittee believes, will follow the acquisition and general availability of an adequate supply of radium. Whereas the best radium practice in Great Britain is as good as that in any country, it must be conceded that Sweden and France, in large measure owing to the interest displayed by their Governments, have made the greater contribution to the stock of existing knowledge in regard to the treatment of cancer with radium.

Estimated Amount of Radium Available for Medical Treatment.

Since 1919 approximately 2.4 grams of radium element recovered from surplus sources of war material has been entrusted by the Government to the Medical Research Council, and by it distributed on loan to hospitals conducting approved schemes of research in radium therapy. Apart from one fraction which has been allocated solely for experimental work, and one which is retained at the Middlesex Hospital as a source of supply of radium emanation (radon), the bulk of the radium thus lent has been used mainly, though not exclusively, for purposes of treatment. The task of estimating the amount of radium available for medical purposes held by institutions and private medical practitioners was complicated by three main difficulties. Hospitals holding a given amount may have added to it in the interval between the publication of two successive annual reports; some hospitals may possess radium of which the subcommittee failed to obtain information; and there may be untraced stocks held by private medical practitioners. With these reservations the subcommittee estimates that, held at present by institutions and practitioners in England and Wales, there are 9.531 grams of radium, which within the next three months will almost certainly be increased to 20.567 grams, and that in Scotland the existing stock of 1.136 grams will, in the same period, be increased to 2.136 grams. Of the amount in England and Wales it is estimated that London will hold 10.767 grams—that is, more than one-half of the total.

[1] Cmd. 3303. H.M. Stationery Office. 1929. Price 6d. net.

The Economic Use of Radium.

The fullest use of radium can be ensured only when there is a sufficient series of patients with the same disease at the institution where the treatment is administered and it is possible to transfer the appropriate applicators rapidly from one patient to another. Not only are such conditions rare in general hospitals admitting cases of all types, but even when a group of hospitals shares a stock of radium its transfer from one to the other must necessarily involve some loss of time. It follows, therefore, that the available radium can be used economically only if in each area radium treatment is concentrated in specialized centres large enough to obtain an adequate supply of patients. In existing circumstances it is possible to calculate the extent to which full use is being made of radium supplies by working out for each hospital the average period during which known quantities of radium are employed in proportion to the total period for which it is available. At the Metropolitan Asylums Board centre for the treatment of cancer of the womb it is calculated, given a steady flow of patients, that the radium might be used for about 70 per cent. of the available time.

Present Requirements.

In Great Britain, from all sources, Governmental and private, the total available radium is approximately 24.9 grams. Of this amount 22.7 grams, or—excluding the Beit gift of 4 grams, the future distribution of which is not at present known—18.7 grams are distributed unevenly over England and Wales, and 2.2 grams are held in Scotland. Of the 18.7 in England and Wales, 12.6 grams are in London, and 6.1 are distributed in the provinces. Assuming that the supply in London were enough for its population of eight millions, then for the provinces, with a population of about thirty millions, the amount required would be at least 24 grams. Calculating on this basis the present radium requirements of England and Wales would be 36 grams or, making due allowance for its probable share of the Beit gift, at least 15 grams more than it holds at present. This calculation taken by itself is, however, quite misleading; it is made on a population basis without allowing for the fact that many cases from the provinces are now treated in London, and that a certain number would continue to be sent to London even if provincial sources were adequate. It is made, moreover, on the untenable assumption that the present requirements of London hospitals are being adequately met. Finally, it makes no allowance for the rapid and continuing progress in the development of radium surgery, and assumes that requirements are in a static condition. For these reasons the subcommittee believes that 20 grams would be a conservative estimate of the present radium deficit in England and Wales, and, calculating in a similar manner, 4 grams in Scotland. If, however, large additions were made immediately to the existing radium supplies great difficulty would be experienced in finding surgeons and hospital beds in adequate numbers to use them; the subcommittee therefore recommends the adoption of a programme which aims at securing a net increase of 20 grams of radium to be available for medical purposes at the end of 1930. Purchases on this scale would give sufficient opportunities for the necessary provision of adequate numbers of trained staff and of beds available for patients treated for cancer with radium.

The Sources of Radium Production.

At present the main source of radium production is Belgium, where 30 or 40 grams of radium element (approximately the amount of the world's present annual consumption) were produced in 1928 from ore mined in the Belgian Congo. The chairman of the subcommittee (Lord Rayleigh, F.R.S.) is satisfied that there is no justification for the view that Belgium holds large reserves of ore. At Oolen, where the Congo ore is worked up, he was shown stock amounting to about fifty tons, and was told that if the factory was not always in full activity it was because the ore did not come in fast enough. Originally, moreover, the ore was

rich that ten tons would yield a gram of radium: now about thirty or forty tons were necessary to produce this amount. Should prospecting fail to discover a richer ore a shortage of radium supply will have to be contemplated eventually. American carnotite ores come second as a potential source of radium, but though radium cannot be extracted from carnotite profitably by the present methods, the United States Bureau of Mines has recently developed a process by which it claims that it may obtain exceptionally high extraction of radium at costs considerably lower than those of existing processes. The subcommittee thinks it improbable that any of the ores mined in Cornwall are abundant enough to yield radium in sufficient quantities to compete commercially with the ores from the Belgian Congo. Canada, Australia, South Africa, India, Ceylon, and Tanganyika, though containing radio-active deposits, are not likely at present to add appreciably to the world's radium supply. Other sources of supply of minor importance are Czechoslovakia, Madagascar, Portugal, and Russia.

The Cost of Production.

Complex problems are involved in estimating the cost of production of radium. Prospecting is usually prolonged and expensive; the estimates of available tonnage in any given mine are of necessity highly speculative, and the estimation of price must be largely guesswork. Until a mine is actually worked out it is impossible to calculate whether any real profit has been made; indeed, a company may sell its product at apparently a high profit, only to find in the end that it has been working at a net loss. The cost of extracting radium is high in relation to the cost of the ore, and owing to uncertainties of demand, and more recently to uncertainties about the delivery of the ore, it has not been found possible to keep the works in constant operation. Factors determining the retail price are the cost of the containers, which are frequently of platinum, and the constantly developing technique in radiotherapy, which necessitates modifications in the form in which radium is to be made up by the manufacturers. Finally, radium is produced only as a by-product of companies engaged in some other form of mining, and it is difficult to determine the profit which is theoretically attributable to each of the company's products. The subcommittee reproduces a calculation made by the United States Bureau of Mines of the cost in August, 1915, of providing 1 gram of radium from low-grade carnotite ore containing about 3 per cent. uranium oxide. The cost of production was £7,752, which, conditions being equal, may be assumed to be considerably lower than the cost of producing an equivalent amount of radium to-day. From this survey of the sources of radium production the subcommittee concludes that if it is decided to make immediately any considerable addition to the stock of radium in this country the only means of doing so is by purchase from the Belgian producers. It holds, however, that if arrangements could be made for purchases to be effected through a single agency it would be possible to buy for substantially lower than the present retail price of £12 a milligram.

RECOMMENDATIONS.

The Need for Co-ordination.

No common policy exists at the present time among the hospitals for the acquisition or use of radium. Institutions buy when and where they can, with the result that stocks have been acquired for particular localities without reference to the needs of the country as a whole. Competitive buying helps to maintain the present high market price of radium; it leads, moreover, to the employment of radium in institutions inadequately equipped with the necessary specialized personnel and other requirements to ensure efficiency. In the subcommittee's view research and treatment by radium must continue for many years to be intimately associated, and any institution that desires to undertake this work efficiently must have an adequate stock of radium, up-to-date *x*-ray installations, facilities for first-class surgery, experienced and highly trained personnel, a fully equipped pathological laboratory, a physics department, and a library—conditions obtaining in some large hospitals and institutions, but generally unattainable except in organized centres.

To deal with the problem of irregular and unco-ordinated distribution of radium as between one area and another, with the difficulties of institutions possessing inadequate supplies, and with the mobilization of radium to the best advantage, the subcommittee proposes not complete centralization, but a form of organization in which the principles of a centralized and of a decentralized system are so adjusted as to give the best results in the various and varying circumstances which will have to be met. It recommends, therefore, that an organization should be established forthwith by the Government for the better distribution of radium in this country, and should be entrusted with the 20 grams of radium which the Government should aim at acquiring at the end of 1930. The necessary organization could be achieved in two ways: the Government might acquire the amount of radium that is needed and entrust its distribution to a Government committee appointed by the appropriate Minister or Ministers, more or less on the same lines as that of the existing Radiology Committee of the Medical Research Council; or it might decide to constitute trustees, in whom the radium bought with the moneys provided by Parliament or otherwise would be vested, and who would appoint an expert body charged with the duty of distribution.

The Proposed Organization.

Of these alternatives the subcommittee prefers the second, and proposes that the Government should constitute a body, entitled the National Radium Trustees, to act as a holding body of the funds provided by Parliament or otherwise, and authorized to purchase therewith and hold radium for the use of a body of experts, a Radium Commission, with functions analogous to those hitherto performed by the Radiological Committee of the Medical Research Council in relation to the radium now held by the Council for research purposes. It recommends, furthermore, that the trustees should be empowered to act as buying agents for the hospitals and other institutions in this country, and for Dominion and Colonial Governments. The Trustees should comprise the following persons:

> The Lord President of the Council (who would naturally be the chairman), the Minister of Health, the Secretary of State for Scotland (as the Head of the Department of Health for Scotland), the President of the Royal Society, the President of the Royal College of Physicians of London, the President of the Royal College of Surgeons of England, the Chairman of the Central Liaison Committee of Voluntary Hospitals in Scotland, the President of the Royal Society of Medicine, and the President of the British Medical Association,

with power to co-opt not more than two additional members. The first duty of this body would be to appoint the Radium Commission, with the following powers and duties:

> "Generally to deal with the custody, distribution, and use of all radium held by the trustees, having regard to the advancement of knowledge, the treatment of the sick, and economy of use; and, in particular, to consider and approve plans submitted to them for the use of radium for the purposes of medical treatment and research, and to make the necessary arrangements for the supply of radium for such uses."

The subcommittee recognizes that the success or failure of its scheme will turn largely on the personnel selected to form the Radium Commission, which, in its view, should be composed not of representatives of particular institutions or interests, but of the best available experts of the several sciences underlying radium therapy; moreover, it must be so constituted as to ensure that it will work in harmonious relations both with the medical profession and with the Government departments concerned. The subcommittee recommends accordingly that the Commission should consist (in addition to the chairman, who should be a distinguished public man but not necessarily a member of the medical profession, and should be nominated by the National Radium Trustees) of eight persons. Of these, four should be nominated by the National Radium Trustees, and one each respectively by the Minister of Health, the Secretary for Scotland, the Medical Research Council, and the Department of Scientific and Industrial Research. The subcommittee suggests that members of the Radium Commission should be appointed in the first instance for a period of four years, and should be eligible for reappointment after an interval of one year, but that the chairman should be eligible for immediate reappointment. It suggests that the nomination of a member by the Department of Scientific

and Industrial Research would constitute a valuable initial link between the Commission and the National Physical Laboratory, which is administered by that Department. The subcommittee further suggests that at an early stage arrangements should be made by the Radium Commission with the National Physical Laboratory for (*a*) the custody of the radium put at the disposal of the Commission by the National Radium Trustees when such radium is not actually in use for medical purposes, (*b*) its preparation in form for use, and (*c*) its recovery from such preparation on return from loan.

It is not anticipated that the annual expenditure on the preparation and recovery of radium or the administrative expenses of the Radium Commission will amount to a substantial sum in relation to the initial cost of purchasing the proposed quantity of radium. Arrangements might not unreasonably be made to secure a set-off to the cost of these services, to be defrayed by a small charge made for the loan of radium by the Commission to institutions. Finally, it is argued that progress throughout the country will be greatly promoted by the free communication of *information as between all the working centres*, and that one of the important functions of the Radium Commission may prove to be the collection and publication of methods and results of radium therapy for the country as a whole.

Provision of the Funds Required.

Discussing the manner in which funds for the purchase of the 20 grams of radium needed immediately might be obtained, the subcommittee favours the following method:

> The money might be furnished in part by the Government and in part by the public. If this course were adopted, the best plan would probably be a public appeal, in which the Government would undertake to contribute pound for pound up to some maximum sum to be determined.

The subcommittee has no doubt that in this way immediate success would be assured, and the £200,000 required could be raised without difficulty. An appeal on these lines from the Government to the public would, in its opinion, secure the £200,000; if not, it would still be possible for the Government at a later stage to furnish some subsidy to stimulate contributions from the public.

> "In making any appeal the Government should make it clear that they did not suggest that all gifts for the purchase of radium should henceforth be placed at the disposal of the National Radium Trustees. The need on the part of the larger institutions to have their own supplies would still continue, and some donors will naturally prefer to equip in this respect particular institutions. There can be no doubt, however, that the most urgent need at the moment is the creation of a distributing organization and the placing at its disposal of an adequate supply of radium for loan or hire to institutions and research workers as and when they require it."

As reported in our last issue, the Chancellor of the Exchequer announced, on April 16th, that the Government accepted the financial recommendations of the subcommittee—in other words, that the Government would contribute up to a maximum of £100,000 on the basis of £1 for every £1 privately subscribed. Mr. Churchill added that the subcommittee's recommendations on the subject of organization had been accepted by the Government in principle, but that the precise form of the organization would remain open to further discussion.

ROYAL MEDICAL BENEVOLENT FUND.

STEADY progress is being made in its beneficent work by the Royal Medical Benevolent Fund, and the report of a very successful year was presented to the annual meeting on April 18th. The increase in subscriptions and donations amounted to £1,032, bringing the total revenue from this source up to £8,623. In its annual report for 1928 the committee placed on record its appreciation of the work done by the honorary local secretaries of the Fund, through whose efforts many new subscribers have been obtained, and also of the co-operation of the British Medical Association. A total sum of £1,667 was received through the Association last year—£800 being an allocation from the Charities Committee, and the remainder earmarked subscriptions sent through the Association or the *British Medical Journal*—an advance of £396 on the previous year. The increased income has enabled the committee to help a greater number of applicants, and also to give larger grants, but in very many cases the amount of the relief is still far from adequate to meet the needs of the case. During last year 485 grants were made, amounting to £8,772, either to medical practitioners who, through old age or illness, were unable to work, to widows of medical men who had been left penniless, and frequently with children to educate, or to daughters of medical men who were too old or otherwise unable to support themselves. In some cases the committee has been called upon to help widows and daughters whose incomes have been lost through unfortunate investments or other causes, but more frequently it has had to assist ladies who have struggled to support themselves by teaching, needlework, or even domestic service until they have become unable to work any longer. Approximately £500 has been expended in the education of orphans, but this branch of the work is mainly undertaken by the Ladies' Guild. An appeal through the medical press for contributions towards children's summer holidays met with a fair response, as a result of which a number of orphans of medical men benefited by a country holiday, and a renewed appeal is to be made this year. The number of annuitants on the Fund, all of them over 60 years old, is now 179, and the total amount paid in annuities last year was £4,816.

Sir Thomas Barlow, who once again presided over the annual meeting, spoke of the great loss which the Fund had suffered through the death of its honorary secretary, Dr. Newton Pitt. Dr. Pitt's work, he said, had always been so quietly and modestly done that many of those who subscribed to the Fund, or who benefited from it, were altogether unaware of the personality and the labour of the man who guided its fortunes with such zeal and wisdom. During the fifteen years that he was its secretary Dr. Pitt devoted a part of every day he was in London to the Fund's requirements, and to all applicants and others he consistently showed the greatest courtesy and kindness. The Fund was fortunate, said Sir Thomas Barlow, in finding so good a successor to Dr. Pitt as Sir Percy Sargent, who was well acquainted with the needs of the Fund and had already done a great deal of work on its behalf. Sir Thomas went on to say how much the committee appreciated the work of the Ladies' Guild. Not only did these ladies look after the needs of wives and families in such matters as clothing, education, and occupation, but they brought into the distressed home a breath of fresh air, and found a way out of very many practical difficulties. The financial results, Sir Thomas thought, had been very satisfactory. The Fund had received yeoman help from the British Medical Association, and in addition to the large accession of revenue from this source, the committee had the advantage of Dr. C. O. Hawthorne, representing the Association, as a member who had rendered great help, which his colleagues highly appreciated.

Sir Charters Symonds, the treasurer, in presenting the statement of accounts, pointed out that, although in the grant department £2,000 more had been distributed than in the previous year, yet the extra cost was only £50—another instance of the economy with which the Fund was administered. In connexion with the annuities the committee had found it possible at last to make six annuities of £100 each. Hitherto the maximum annuity has been £40; these increased annuities had been made possible largely as the result of a bequest of the late Dr. Alexander Lawrence, and it was hoped to increase their number during 1929. To be able to give a larger annuity had long been a cherished hope of Dr. Newton Pitt, and it was some satisfaction to feel that this step was taken by the committee some little time before Dr. Pitt's death.

On the motion of Dr. Hawthorne, Sir Thomas Barlow was re-elected president, Sir Charters Symonds treasurer, and Sir Percy Sargent and Mr. R. M. Handfield-Jones were made joint honorary secretaries. Twenty-two additional vice-presidents were also elected.

British Medical Journal.

SATURDAY, APRIL 27TH, 1929.

THE CARE OF MENTALLY DEFICIENT CHILDREN.

THE long promised and patiently awaited report of the Joint Committee of the Board of Education and the Board of Control on Mental Deficiency[1] was published last Saturday. Even so, it is published only in part. That portion of the report which deals with adult defectives is still mysteriously withheld. Neither delay nor withholding is the fault of the joint committee themselves; indeed, in a prefatory note they mildly protest that the "proper sequence and right perspective" of their report has been damaged thereby, as well as its "coherence and force." In the public interest it is necessary to press for, even to insist upon, the early publication of the missing Part III. It would be very valuable at the present time, when schemes involving the care of adult mental defectives are being considered by local authorities in connexion with the Local Government Act; and no individual, however advantageously placed, should be able to keep from the public the considered opinions of a body of persons pre-eminently competent to influence and guide those interested in the subject with which they deal.

Incomplete as it is, the report is extraordinarily interesting and full of valuable suggestions, pointing not merely to the eradication of imperfections of detail in our present system of dealing with mentally defective children, but to a radical revision of the system itself. After describing the nature of mental defect and reviewing the present legislative and administrative arrangements for the care of mentally defective children, both educational and other, the committee gives an account of the special investigation into the incidence of mental deficiency in six selected and representative areas by Dr. E. O. Lewis, whose detailed and invaluable report forms Part IV of the committee's publication. They find that the total number of mentally defective persons in England and Wales is over 300,000; that this incidence figure of some 8.5 per 1,000 population is approximately twice as great as that given by the Royal Commission on the Feeble-minded in 1908; that the incidence of all grades of defect in urban areas is 6.7 per 1,000, as compared with 10.5 in rural areas; that after all allowances have been made there has been some definite increase in the incidence of mental deficiency during the past twenty years, and that this is connected intimately with other important social problems. The committee then suggests a scheme for the future allocation of responsibility for children between local education, mental deficiency, and other authorities, and for the educational provision to be made, and they wisely include in this scheme the large marginal group of educationally retarded children not now described as mentally defective in the narrow sense. No doubt, as is the case with most reports of Governmental committees, many people will be content to read only the chapter summarizing the conclusions and recommendations, and for those who have only a very general interest in the subject this, together with the chapter on the nature of mental defect, may suffice; but the whole report is so authoritative, so well thought out, and so well expressed, that the whole of it is to be commended to the consideration of teachers, medical officers, social workers, and administrators alike.

The system proposed by the committee can be described here only in outline. Assuming, as is now generally agreed to be desirable, that the age of compulsory school attendance will be from 5 years of age to 15, and that there will be an educational break and review of attainment and capacity at 11 years of age with a wide variety of educational opportunity thereafter, it is proposed that there shall be no differentiation in these age limits as between normal and mentally defective or retarded children. It is proposed, too, that there shall be no need to "certify" children as mentally defective before they can be sent to a "special" school, but that all children and schools alike should be retained within the normal public elementary education sphere, provision being made, both before and after 11 years of age, for groups of children of varying educational capacity. There would have to be some degree of compulsion so that an education authority could secure the attendance of a child at the school or class most suitable for his requirements, and the need for certification would remain in the case of those children who were found to be "uneducable" (say, with a mental ratio under 50 or 55), or who were so socially as well as educationally defective as to require the care of the mental deficiency authority. For children of the lowest type occupation centres rather than schools would be provided unless they were sent to residential institutions; and it is not contemplated that local education authorities would as a rule set up separate schools or departments for the younger retarded children (whether feeble-minded, dull, or backward) except in the largest towns; but at the age of 11 years or so such children would be transferred to schools or classes where their education and training would be specially adapted to their needs along the lines followed in the best of our existing special schools. This would be a part of the general reorganization of post-primary education which is contemplated in the near future. This outline scheme is worked out in detail in chapter viii of the report, and a clear diagram of what is intended is given. The suggested educational provision for three age groups and for three grades of mental ratio is shown, and the respective spheres of the local education authority and the local mental deficiency authority are indicated.

There are a good many difficulties in the working out of this plan, but, if the plan itself be approved, they are not insurmountable. Some conspicuous merits of the plan will be evident to those who are familiar, whether as administrators or as teachers, with the working of existing arrangements. They are clearly brought out in the report, which contains also a number of minor but very valuable suggestions for improving these arrangements and more effectively carrying out what no doubt Parliament intended to be done by its Education Acts and Mental Deficiency Acts. The report is certain to be the subject of much discussion by persons interested and expert in the subjects with which it deals, as at the conference under the auspices of the Central Association for Mental Welfare at the moment taking place. The existence of the joint committee has from time to time been made the official excuse for discouraging action on the part of local authorities, and it is to be hoped that now that this part of its report has been published

[1] London: H.M. Stationery Office. 1929. 5s. net.

speedy progress may be made by Government departments and local councils in making provision for the most appropriate instruction and care for feeble-minded, mentally retarded, and socially defective children.

THE CURABILITY OF ASTHMA.

No disease offers more interesting problems for solution than asthma, and none has been the subject of more intensive study during the last few years. Numerous papers and books have been published on asthma in England, America, and on the Continent, and it is one of the subjects chosen by the Section of Medicine for the Annual Meeting of the British Medical Association to be held in Manchester next July. Several asthma clinics have been established in America and Canada, and a journal for asthmatic patients is published in Germany and one for sufferers from hay fever in America. This widespread activity in the investigation of the asthma problem has certainly led to a great increase in our knowledge of its pathogenesis, but this knowledge is still very incomplete, and it is doubtful whether any corresponding advance in the treatment of the condition has resulted. There appear to be as many uncured asthmatics in Great Britain to-day as at any previous period, and the numerous so-called cures of the present time seem to be little more effective than those which were announced with equal enthusiasm twenty-five years ago. In one particular alone is the lot of the asthmatic infinitely better than it was formerly, and that is in the treatment of the attack itself; the irritating and often ineffective powders and inhalations of the past are no longer required since the discovery in 1904 by Dr. Bryan Melland of the immediate and complete relief which follows the injection of adrenaline. We cannot, however, feel satisfied until means are found of permanently preventing the attacks, and so rendering the use of adrenaline superfluous.

Asthma has been defined as the reaction of an over-excitable bronchial nervous system to blood-borne irritants and to peripheral and psychical stimuli. During the last few years much has been learnt about the factors concerned in setting the asthma centre into activity, but unfortunately little is still known about the cause of the constitutional and often inherited condition which manifests itself in an irritable bronchial nervous system. It is true that the less frequently attacks occur the less tendency there is for attacks to be produced by stimuli which were at one time operative. To this extent treatment directed to the removal of the exciting causes also favourably influences the constitutional basis of the disease. But the latter remains, though less active, and a man who has once had asthma remains liable to it for the rest of his life, even if he is free from attacks for ten or twenty years. A true "cure" of asthma would therefore consist in the eradication of the factors upon which the actual excitability of the bronchial centre depends. Dr. Oriel, working in the asthma clinic founded by the Asthma Research Council in conjunction with the Medical Research Committee at Guy's Hospital, has obtained some evidence of a biochemical basis for the condition, and there is reason to hope that work on these lines may lead to an effective means of overcoming the constitutional basis of asthma. The dietetic treatment long advocated by Dr. Adam of Glasgow probably acts by correcting these biochemical abnormalities.

The remarkable effect of residence in the Alps, emphasized in the recent book by Dr. Grimm on the effect of climate on asthma (reviewed at page 769), is probably also due to the influence of altitude on the biochemistry of the blood. The benefit derived from a visit to the Alps is experienced very rapidly by nearly all asthmatics. Though a relapse generally occurs sooner or later on returning home after a short stay, most asthmatic children can be permanently cured by a prolonged residence in the mountains, even when every attempt to procure relief by diet, desensitization, and nasal treatment at home has failed. The improvement which sometimes follows such diverse forms of treatment as diathermy, ultra-violet rays, x rays, and the various methods of inducing so-called protein shock is probably due to some influence which diminishes the excitability of the bronchial nervous system, but unfortunately the benefit obtained is only temporary, and the treatment tends to become less effective on repetition.

The striking difference of opinion as to the curability of asthma which our correspondence columns have recently revealed is due mainly to differences in the use of the word "cure." Most physicians of experience have seen many asthmatics who have been "cured" repeatedly by those who pin their faith on single methods of treatment, whether this is directed to desensitization, nasal cauterization, or any of the innumerable other "cures" for asthma, each of which has its enthusiastic advocates. It is obvious that a patient with cat-asthma will get relief if he avoids cats; this was shown by Hyde Salter sixty years ago, and it does not require the modern methods of skin tests to discover it; but the patient is not cured, as he still has an irritable bronchial nervous system, which is liable at any time to respond to other chemical, reflex, or psychical stimuli. In the same way the asthmatic who is told that he is sensitive to feathers and will be cured by using a kapok pillow rarely remains free from attacks for long. He may even develop a hypersensitiveness to the mould which Storm van Leeuwen has shown is apt to develop on kapok, and it is interesting to note that in countries in which kapok pillows are habitually used it is as fashionable to recommend feather stuffing for the pillows of asthmatics as the reverse is in England.

The remarkable diversity in the methods of treatment which have been said to cure asthma is an indication that the only satisfactory way of dealing with the condition is to have every case as thoroughly investigated as possible for the various chemical, reflex, and psychological factors which may irritate the bronchial centre. By means of a well-taken history it is generally possible to discover whether an individual is sensitive to bacterial toxins, animal emanations, foods, pollen, or other chemical substances. The value of skin tests as a means of confirming suspicion aroused by the history has unfortunately proved disappointing in the hands of many observers. The source of bacterial toxins may be found in an infection of the bronchi themselves, the tonsils, nose, teeth, and alimentary tract. Among reflex causes the nose is the most important, but the stomach, rectum, and even the genital organs, require consideration. Lastly, there is no doubt that an individual with the asthmatic constitution may develop attacks as a direct result of psychological disturbances, and no case can be regarded as completely examined without attention being paid to this factor. Such an investigation is always worth undertaking, as the treatment based upon the results obtained is at least likely to remove some of the chief causes of

acks in the individual concerned. But until more known about the nature of the underlying constitutional abnormality anything in the nature of a genuine re will continue to be a very unusual occurrence.

It is clear from what has been said that the need ll remains for much further research into the oblem of asthma. The non-medical sufferers from thma, who found themselves no better after trying most every known asthma "cure," were well advised hen they inaugurated the Asthma Research Council, cause it is only by a broad scheme of research into ery aspect of the problem that a satisfactory solution re will continue to be a very unusual occurrence.

CHILDREN AND THE FOUNDLING HOSPITAL SITE.

VER since the Foundling Hospital site was bought by ie Foundling Estates Ltd. in November, 1926, there as been a feeling among the majority of the public hat the children of London had a moral claim upon his piece of land, which had been dedicated to the use f children for the past 200 years. It was no doubt a part due to this feeling that various building chemes, including that for transferring Covent Garden Iarket and that for a national theatre and opera ouse, were abandoned, and the original suggestion or hotels, luxury flats, etc., on the site also fell hrough. Hopes were high when the Board of Ianagement of the Great Ormond Street Hospital for ick Children entered into negotiations with the syndiate which had bought the site. The proposal was hat the public should have the use of the greater part f the grounds as a park and playground for children, vhile on about four acres of the north portion a new hildren's hospital should be built. Money, it was tated in a letter to the *Times* last November, was the ole obstacle to the realization of these plans, and a ast-minute appeal was made, but without response. Vhere the matter stood until it was announced last veek that Lord Rothermere was paying a deposit to ecure the Foundling site until June, 1931. According o the published reports (exact details have not yet been issued) there is a condition attached to this generous action—namely, that the entire site shall be used as a children's park, subject to the reservation that for one month in the year this park shall be placed at the disposal of the British Boy Scouts Association for a camping ground. The Board of Management of the Great Ormond Street Hospital for Sick Children are hoping that Lord Rothermere may be induced to see that the claims of this hospital for a portion of the Foundling Hospital site are at least equal in importance to the necessity of a playground for the children in the immediate vicinity. The present Children's Hospital has been built up piecemeal from its small beginnings in 1852, and is in a somewhat airless and sunless situation. Compared with similar institutions abroad it is hopelessly out of date, and does a magnificent work in very difficult circumstances. Foreign visitors still flock to take advantage of the wonderful clinical material which it offers, but they have to visit provincial cities, such as Birmingham and Glasgow, to find a children's hospital built in the style to which they are accustomed in their own country. The opportunity of erecting a modern hospital for the treatment of children's diseases in the richest city of the world on a site which has all the advantages of centrality and accessibility is one which every lover of children must hope will not be allowed to slip away. The Great Ormond Street Hospital serves not only Greater London, but draws patients from all over the country, and even from foreign parts. If the children have a moral claim on the Foundling site, what could be better than that the sick child and the well child should both enjoy this great open space? That the Great Ormond Street Hospital does serve all the children of this country is illustrated by Sir James Barrie's most charming and generous gift of all the rights in *Peter Pan* for the use of the hospital. This will mean a welcome addition to its annual income amounting to at least £2,000, and all the children who flock to greet their hero every Christmastide will be helping to support a worthy institution. What could be a more fitting sequel to Sir James Barrie's gift than that others should follow Peter's lead, and enable the board to put up a modern building on the Foundling site?

RADIUM POLICY.

We publish this week at page 772 a full account of the report by the Radium Subcommittee of the Committee of Civil Research on the radium requirements of Great Britain in relation to the present sources of supply. It may be assumed that the Government, having already accepted in principle the subcommittee's recommendations on the subject of organization, will immediately set up a body of Trustees to hold the funds provided by Parliament and otherwise and to purchase therewith radium for distribution by an administrative body of experts to be known as Commissioners. Four of the nine National Radium Trustees whom the subcommittee proposes should be appointed in the first instance are medical men of the highest standing—the Presidents respectively of the Royal College of Physicians of London, the Royal College of Surgeons of England, the Royal Society of Medicine, and the British Medical Association. The holders of these offices at the present time are Sir John Rose Bradford, Lord Moynihan, Lord Dawson, and Sir Ewen Maclean. Through them the opinion of the medical profession will be expressed in the nomination by the Trustees of five out of the nine Radium Commissioners whom the subcommittee recommends should be appointed to take general charge of the radium held by the Trustees and to make all arrangements for its distribution. The constitution and personnel of the Radium Commission are clearly matters of the utmost importance for the successful working of a national scheme. In the subcommittee's view this body should be composed of "the best available experts in the several sciences underlying radium therapy." All will agree that such experts are indispensable, but we cannot insist too strongly on the need for full medical representation also, and in particular for the inclusion of men familiar with the use of radium in medical practice. This point is implicit in the letter by Mr. Souttar printed at page 787, and we may hope that it is being borne in mind by the Government while the details of organization still remain, if not fluid, at least unsolidified.

HELMINTHIC INFECTIONS.

We are privileged to print elsewhere in our columns this week (p. 755) a lecture on some epidemiological and serological aspects of helminthic infections by Professor F. Fülleborn of the Tropical Institute at Hamburg. Professor Fülleborn is one of the foremost of Continental parasitologists, and his work on helminthology has won the appreciation of scientists in all parts of the world. The subject on which he speaks with such authority is a most important one to an empire such as ours, controlling as we do vast tracts of tropical and semi-tropical country. Hookworm

disease, it is true, has not the spectacular appeal of the great killing diseases such as malaria, tuberculosis, and syphilis, but the parasites do cause a definite amount of debility, anaemia, loss of weight, and lethargy, which have a definite economic effect on the patient. Moreover, they predispose to other infections, and in conjunction with slight attacks of such diseases as malaria or with malnutrition—in themselves perhaps not very harmful—a serious condition is produced and a considerable mortality results. When it is borne in mind that at least two-thirds of all the inhabitants of tropical and subtropical countries harbour these parasites, it is obvious that ankylostomiasis is one of the most important of imperial diseases, causing, directly or indirectly, much economic loss, sickness, and even death. In India alone it is estimated that 45 million wage earners are infected, with a loss in wage-earning power of over Rs500 million yearly. This is only an isolated example, which could be multiplied indefinitely from Africa, America, and the East generally. Other parasites are equally prevalent, and some of these are mentioned in Professor Fülleborn's paper. Ascaris is even commoner than hookworm in many parts, and it is not by any means confined to warm countries. While hookworm principally affects older children and adults, ascaris is found in infants even more frequently than in their elders. Its pathogenic properties are not yet well understood, but they are probably considerable. Man, where parasites are concerned, is intimately interested in the forms in lower animals, as the paper indicates, and the intense irritation caused by the wandering of foreign parasites in his skin, described by Professor Fülleborn, is a problem which more particularly concerns white people in the tropics. The helminthic parasites are amongst the oldest known causes of disease, but the modern study of bacteriology and protozoology has tended to eclipse their continued importance. Professor Fülleborn's paper is accordingly a timely reminder not only that disease is international, but that the older known and comparatively gross causes must not be overlooked in these days of the excessively minute.

MEDICAL ASPECTS OF A POLITICAL PROGRAMME.

We are not concerned with the speech with which the Prime Minister opened the Conservative General Election campaign last week in its party political aspects; but the speech contained references to matters in which the medical profession is greatly interested—factory legislation, slum clearance, education, and the health of mothers and children—and these statements are, of course, of considerable importance. The position with regard to the Factory Bill is highly unsatisfactory. It is a departmental bill, prepared by the Home Office, and was introduced in the first instance under the last Labour Government. It consolidates and amends factory legislation in a way which, on the whole, is desired by the medical profession in the interests of public health. Repeated pledges to pass it into law during particular parliamentary sessions have been broken, and though the Prime Minister now renews this pledge in the form that the bill "will be one of the first of the measures we shall pass in the new Government," recent history cannot be forgotten, and there is no statement as to whether the bill will cover the wider field that was originally intended or will assume the truncated form which is apparently more acceptable to the present Home Secretary. Committees of the British Medical Association and of the Society of Medical Officers of Health have jointly made considered recommendations to the Home Office with regard to certain proposals contained in the bill, and it will probably be necessary to press these again at an early date upon whatever Government is in power after next month's election. It was at the autumn dinner of the British Medical Association in 1927 that Mr. Chamberlain first made the announcement that the Government, considering that their housing programme had made sufficiently satisfactory progress, would shortly devote themselves to the clearance or reconditioning of slum areas, many of which had remained unaffected by the provision of new houses. Mr. Baldwin now says that this "will be a task to which the new Government will devote the whole of its strength and mind after the election." This is satisfactory so long as it is understood that "reconditioning" means more than mere cleansing, decoration, structural repair, and minor sanitary improvements. The Prime Minister claimed more for the education record of the Government than will probably be allowed by those most interested in that sphere of communal activity. There is, indeed, a general impression that in this sphere there has, on the whole, been a lack of encouragement and a damping down of progress during the past few years. It is to be hoped that Mr. Baldwin's words indicate a real desire to move forward with greater rapidity on lines which are generally agreed upon. On the subjects of maternity and child welfare the Prime Minister's statement was of peculiar importance and interest. It is gratifying to note that public health in several spheres is to be a matter of somewhat special regard. The care of children between the ages of 1 and 5 years was referred to thus: "One of our first acts will be to form a strong committee of inquiry into this whole subject to advise us what would be the best way of treating it." If and when such advisory committee is appointed it will be important to secure proper medical representation thereupon, and especially among its personnel some who have had experience of general family practice. With regard to maternity Mr. Baldwin said: "We have come to the conclusion that maternity benefit under the National Health Insurance Act is not at present being expended to the best advantage. Proposals are therefore under our consideration for making available to insured women and to the uninsured wives of insured men proper medical and midwifery services during pregnancy and childbirth, in addition to providing some cash payment on confinement." This will be heartily welcomed by the British Medical Association. It will be remembered that both before the Royal Commission on National Health Insurance and, more recently, before the Departmental Committee on the Training and Employment of Midwives, the Association has given evidence to the same effect. In the Annual Report of the Council, Appendix IV, printed in last week's *Supplement*, an admirable statement of the position and of certain general proposals will be found under the subheading of "The Ideal Midwifery Service" (p. 124). Recently, too, the Council sanctioned the appointment of a special subcommittee to formulate a detailed scheme for a maternity service in connexion with the national health insurance system on the lines laid down in the evidence referred to. This action was very opportune, and it is hoped that even by the time the Representative Body of the Association meets in Manchester in July the profession may have before it such a scheme prepared on the initiative of the profession itself. This may prove very helpful to whatever Government may then be in power, and will certainly provide a basis for the criticism of any Government proposals in this important and urgent matter.

THE STATUS OF THE RADIOLOGIST.

In a special hospital issue of the *Journal of the American Medical Association* published on March 30th, there appear a number of papers discussing, among other things, "Radiology as a medical specialty" and "The status of radiology in America." It is quite clear from the statements made that the same problems confront radiology in the United States as in Great Britain. In brief, the main points are those which concern lay radiologists, the hospital position, the status of the trained medical radiologist—is

he a mere technician or a medical consultant?—and the prospects and future position of radiology and radiologists. Technique has been made so simple by the improvement in apparatus and tubes that the younger generation are unable to visualize the difficulties of the pioneers. Anyone with average intelligence and dexterity can, in a very short time, be taught how to produce good films of various conditions. It is unfortunate that the public generally, many medical practitioners, and even a number of consultants, still consider that the "picture" is all that is required, and are not prepared to look upon the radiologist as a consultant; they hold, in short, that it is the pictures which are paid for, and not the opinion. The competition of hospitals, and the status of the medical radiologists attached to them, are becoming increasingly important. No hospital now, cottage or otherwise, considers itself properly equipped without an *x*-ray department, but whether a duly qualified radiologist is in charge of the department is often a secondary consideration. There is also a definite tendency among the lay members of hospital committees to authorize payment for *x*-ray work done in the institution—in fact, to make money out of the *x*-ray work. None of these things are for the good of either the public or the medical profession. The profession, if united, could in a very short time considerably improve matters. It is in the interests of the profession that *x*-ray work should be in the hands of duly qualified and specially trained medical men and women, and that the status of such specialists should be exactly the same as that of others who devote themselves to special work. No lay radiographers should work in hospitals or in private practice except under expert medical control. If this was the rule, as it should be, the status of those devoting themselves to a most difficult branch of medical practice would become higher, the standard of radiography would improve, and this work would attract more of the best students than it does at present.

SECURITY OF TENURE IN PUBLIC POSTS.

THE Minister of Health received last week a deputation from the National Association of Local Government Officers and the National Union of Public Employees, in regard to the position arising as a result of the recent decision of Mr. Justice McCardie in the case of Brown *v.* Dagenham Urban District Council, which was discussed in a leading article in the *Journal* of March 9th (p. 461). The deputation was introduced by Sir Herbert Nield and Mr. Wills, who drew attention to the fact that the purport of the decision was that certain local government officers were liable to dismissal without notice or reason given, even in the case of an appointment that had been made upon condition that its termination should be subject to a specified notice. The Minister said that he appreciated the serious results of the decision, which he accepted, of course, as a correct interpretation of the law. While he agreed that the matter could not be left where it was, he pointed out that legislation would be required to alter the present position, and it was obviously impossible for him either to introduce legislation in the present Parliament or to give at the moment any pledge binding on a future Government. In the circumstances it seemed to him that the best course would be to refer the matter to the Royal Commission on Local Government for their examination, and he undertook that this should be done at once. The British Medical Association is in close touch with the National Association of Local Government Officers on this matter, and deferred asking the Minister to receive a deputation until the result of the previously arranged deputation was known. The views of the British Medical Association have been placed before the Minister, and further developments will be followed.

VACCINATION FOR BRITISH VISITORS TO FRANCE.

ON April 20th there took place at Calais the conference announced in our last issue (p. 738), between representatives of the French and British Governments, to discuss the precautionary measures that should be adopted in view of the occurrence of cases of small-pox in certain British ships and the fact that other cases were under treatment in Great Britain. In relation to the ships arriving from the Far East it was decided to apply, on the sole responsibility of the French Government, the measures prescribed by the International Convention of June 26th, 1926; this action has already resulted in the tracing of the alleged case of small-pox in the *Mashobra* and the isolation of cases at the quarantine station at Frioul. To deal with ships coming from British territory where small-pox patients from India have been landed and are now under treatment, the French Government has requested the British Government to secure the medical examination, before they disembark, of all passengers leaving England for the Continent. By the Convention of 1926 the French Government may also keep under observation unvaccinated persons coming from territory in which there is an epidemic, even though they arrive in ships which have had no case of small-pox on board. To this end the French Government has decided that from April 21st until further notice all passengers landing in France, except those possessing a vaccination certificate not less than ten days and not more than five years old, will be required to fill up a sanitary passport, to be obtained en route, and will be kept under observation in France for fourteen days if necessary. Passengers from England to whom these passports have been issued must supply the French authorities with a statement of their addresses and movements during the first two weeks of their stay in France. They are required to report themselves to the health authorities or mairie of each place they visit, and not to leave any place within fourteen days except with the permission of the authorities. The mere vaccination of passengers before they disembark is not considered an adequate measure of protection, since it will not prevent the disease from appearing in, or spreading from, persons in whom it is already in a state of incubation. The mayor of Le Havre's decision to enforce locally the original instruction that passengers from England must either produce a certificate of vaccination within the past two months or be vaccinated before landing has resulted in a considerable fall in the number of passengers entering France by this route.

STRANGEWAYS MEMORIAL FUND.

SOME two years ago a fund was inaugurated in memory of Dr. T. S. P. Strangeways of Cambridge, who died on December 22nd, 1926.[1] In the opinion of the official members of the committee the time has now come when this fund should be vested in trustees under a deed, and a meeting of the committee (at the rooms of the Royal Society of Medicine, 1, Wimpole Street, W.) will be called for May 16th, at 5 p.m., to give instructions to the treasurers. The deed must provide for the judicious use of the fund during the next fourteen or fifteen years to secure the education of the four younger children (the three elder having graduated with honours since the fund was first administered, and having begun their careers). Donations have been very generous, but have not quite reached the figure calculated in the appeal. Anyone who has not yet paid in an intended subscription should send a cheque at once to Lloyds Bank, Cambridge, crossed "a/c Strangeways Memorial Fund," or a cheque drawn in the same way may be sent to Sir Humphry Rolleston, Bt., K.C.B., Southfield, Trumpington Road, Cambridge.

[1] *British Medical Journal*, February 12th, 1927, p. 283.

YEAST AND PUFFERY.

THE old pharmaceutical term for yeast was *Faex medicinalis*. We are reminded of this rather unpleasant name for a useful substance by some highly objectionable advertisements of a proprietary brand of yeast that have been appearing lately in popular American and Canadian journals which circulate also in this country. Each of the florid advertisements we have seen (and we have seen far too many) occupies a whole page of the periodical, and includes what purport to be signed testimonials from medical men in Europe or the United States. Each panegyric adjoins a portrait of the person to whom it is attributed, with a few fulsome words about him by way of introduction. A sketch map of Europe at the bottom of one of these advertisements bears the following legend:

> FAMOUS EUROPEAN M.D.'S CITE YEAST BENEFITS.
> London, Paris, Berlin, Vienna, Copenhagen . . . What would you give for a health prescription from leaders in these great medical centers? . . . They give you, here, the benefit of their experience!

It is indeed, in the words of Hamlet, "a kind of yesty collection." We must deplore the fact that the owners of a proprietary article have thus made use of the names of members of the British medical profession. It is scarcely credible that the medical men whose names have been used in this way have been parties to it, and we hope, therefore, that we may have an opportunity of publishing their disclaimer.

THREE lectures on drug-like actions of some food constituents will be delivered by Professor E. Mellanby at University College, Gower Street, W.C.1, on Monday, Tuesday, and Wednesday next at 5.15 p.m. Dr. J. A. Gunn, professor of pharmacology in the University of Oxford, will preside at the first lecture. Professor S. J. Cowell will deliver the inaugural lecture of his course of six lectures on dietetics at St. Thomas's Hospital, S.E.1, on Thursday, May 2nd, at 5 p.m., when the chair will be taken by Sir Arthur Stanley, treasurer of the hospital. The other lectures will be delivered on succeeding Thursdays at the same hour. Professor T. R. Elliott will take the chair at the first of two lectures on some of the sequels of epidemic encephalitis lethargica, to be delivered at University College, Gower Street, by Dr. A. J. Hall, professor of medicine in the University of Sheffield, on Friday next at 4 p.m.; the second lecture will be delivered on May 10th. Admission to all the lectures is free.

THE KING.

THE bulletin published on April 15th said that His Majesty continued to make satisfactory progress, and the rheumatism of the right shoulder was yielding to treatment. A week later, on St. George's Eve, the King himself addressed from Craigweil House a message to his people, which has caused universal gratification. The publication of this personal message is generally, and very naturally, regarded as meaning that the King is convalescent, and that his complete recovery is now only a matter of time and reasonable care. Our profession will especially value His Majesty's words of gratitude for "the wonderful skill and devotion" of the medical men and nurses whose care has brought him back from danger.

FIFTH INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY.

As previously announced, the fifth International Congress of Military Medicine and Pharmacy is being held this year in London from May 6th to 11th; its meetings will take place in the Great Hall of the British Medical Association, the Board Room of the British Dental Association, and the Lecture Hall of the Pharmaceutical Society of Great Britain. Official delegates have been appointed by the following countries: Albania, Argentine Republic, Australia, Bechuanaland Protectorate, Belgium, Canada, Chili, Czechoslovakia, Cuba, Denmark, Ecuador, Egypt, Estonia, France, Greece, Hungary, India, Irish Free State, Italy, Japan, Lettonia, Netherlands and Netherlands East Indies, New Zealand, Nicaragua, Norway, Persia, Peru, Poland, Rumania, Salvador, Siam, Spain, Sweden, Switzerland, United States of America, Uruguaya, and also by the League of Red Cross Societies and the International Committee of the Red Cross. Some 800 foreign delegates and members, including 300 ladies, will attend the congress; the total number attending will be approximately 1,100, and the membership list is now closed.

The congress will be inaugurated by Sir Laming Worthington Evans, Bt., Secretary of State for War, who will also open the exhibition of service medical equipment, drugs, dressings, and surgical instruments in the House of the British Medical Association. The subjects to be discussed are as follows:

1. Evacuation of sick and wounded by air and water. The role of the medical service in combined operations. Reporting countries: Great Britain and France.
2. Tropical fevers of short duration. Reporting countries: *Great Britain and the Netherlands.*
3. Injuries to blood vessels and their sequels. Reporting countries: Great Britain and Belgium.
4. Physical and chemical analysis of the glass and rubber articles employed by the medical services. Reporting countries: Great Britain and Spain.
5. The standard of dental and physical fitness in the various military services. Reporting countries: Great Britain and Cuba.

The following official visits are being arranged. At Aldershot demonstrations will be given at the R.A.M.C. Training Centre, the School of Hygiene, the Cambridge Hospital, the Dental Centre, and various R.A.S.C. establishments. The barracks will be shown, and there will be a display of physical drill. An excursion will be made to Portsmouth, where members of the congress will be shown over H.M.S. *Hood*, the *Victory*, the Submarine Depot, and Haslar Hospital; a demonstration of the method of removing the sick to and from battleships will be given. The Lord Mayor and Corporation of Portsmouth will entertain the visitors to luncheon. During a visit to Halton members will be shown over the R.A.F. hospital, barracks, and workshops, and ambulance airplanes.

The Prince of Wales will receive the principal official delegates, and an official dinner will be given to them, followed by a reception at Lancaster House for all members of the congress. A banquet will be given by the Lord Mayor and Corporation of the City of London. There will be receptions by the Royal College of Physicians, the Royal College of Surgeons, the Royal Army Medical College, and by Dr. Henry S. Wellcome at the Wellcome Historical Medical Museum. The Society of Apothecaries, the British Dental Association, and the Pharmaceutical Society of Great Britain will entertain members of the congress.

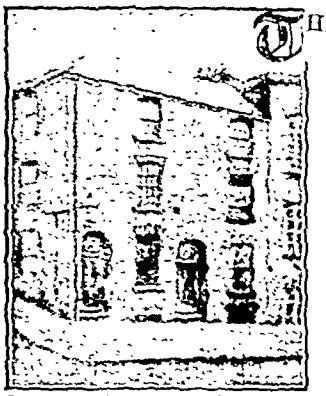
Facilities for inspecting the Tower of London, Hampton Court, and the various London museums will be afforded, and visits to the Royal Mint are being arranged. The interests of ladies are being well provided for. The executive committee of the Forum Club, Grosvenor Place, has invited ladies attending the congress to a reception on May 10th, and a visit will be made to Ham House, on the invitation of the Earl of Dysart. A visit to the Guildhall has been arranged, followed by receptions by the Grocers' and Drapers' Companies; receptions will also be given by the Institut Français du Royaume Uni for French ladies, and by the British Italian League at the Ladies' Army and Navy Club for Italian members of the congress.

NINETY-SEVENTH ANNUAL MEETING

of the

British Medical Association,

MANCHESTER, 1929.



THE PUBLIC INFIRMARY IN MANCHESTER, 1752.

THE ninety-seventh Annual Meeting of the British Medical Association will be held in Manchester next summer under the presidency of Mr. Arthur H. Burgess, F.R.C.S., Professor of Clinical Surgery in the University of Manchester, who will deliver his address to the Association on the evening of Tuesday, July 23rd. The sectional meetings for scientific and clinical work will be held, as usual, on the three following days, the morning sessions being given up to discussions and the reading of papers, and the afternoons to demonstrations. The Annual Representative Meeting, for the transaction of medico-political business, will begin on the previous Friday, July 19th, at 9.30 a.m. Preliminary notes of the subjects for discussion in the nineteen Scientific Sections are published in the *Supplement* this week, together with the names of the officers of Sections, and further details of the arrangements for the Annual Meeting will appear from time to time in later issues. The sectional meetings will be held for the most part in the buildings of the University. During the week, and in particular on the last day of the meeting (Saturday, July 27th), there will be excursions to places of interest in the North-West of England. We publish below the third of a series of descriptive and historical notes on Manchester and neighbourhood written for the occasion by Dr. E. M. Brockbank. The first article appeared on December 1st, 1928 (p. 1003), and the second on January 26th, 1929 (p. 167).

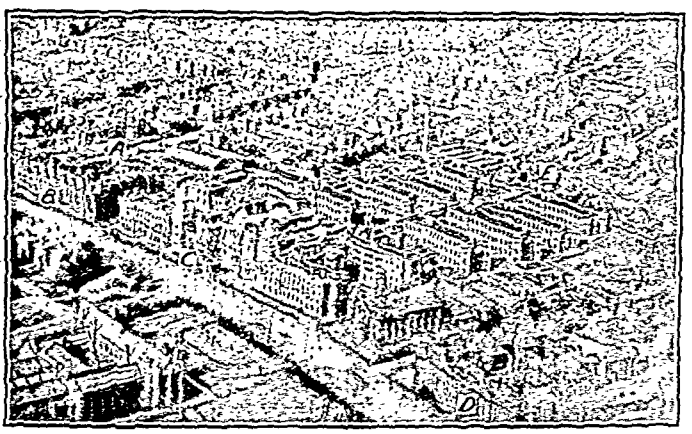
THE HOSPITALS OF MANCHESTER AND SALFORD.

VOLUNTARY HOSPITALS.

THERE are fifteen voluntary hospitals in Manchester and one in Salford, with approximately 2,500 beds in all. In Manchester the Royal Infirmary, Ancoats Hospital, the Jewish Hospital, and in Salford the Royal Hospital, are general hospitals, the remaining twelve being devoted to one or other special form of disease. Two of the special hospitals, those for diseases of the eye and of children, have the Royal patronage.

According to the report of the local Medical Charities Fund the ordinary annual expenditure of these sixteen hospitals is about £350,000, and the ordinary income is about £320,000—a deficit of £30,000 per annum. Some hospitals work at a loss, others are able to keep within their income. This, like that of all voluntary hospitals, comes from subscriptions and donations, interest on investments, collections from various sources, contributions from patients according to means to pay, payments from approved societies and local authorities (*tuberculosis and venereal disease*), etc. As in other towns, the number of subscribers is comparatively few, and the names of most of them are to be seen on several of the hospital lists.

All the hospitals suffer from want of beds, which is the natural result of the growth of the population and of the great increase in the treatment of disease by surgery, especially of appendicitis, gastric and duodenal ulcer, and ear disease. Nearly all the voluntary hospitals have hundreds of patients awaiting admission for treatment, the latest exacting demand being for investigation of glycosuria and its treatment by insulin. Furthermore, the modern methods of laboratory diagnosis and of physical and electrical treatment require an amount of space undreamed of by architects even of this century.



AN AERIAL VIEW OF MANCHESTER.
A, Radium Institute. *B*, Royal Eye Hospital. *C*, Royal Infirmary. *D*, St. Mary's Hospitals. *E*, Christie Cancer Hospital.

The heavy waiting lists are due to the very large number of cases sent from outside the two cities. The cost per bed in hospitals has trebled since August 4th, 1914, and for a variety of reasons, an important one being the above-mentioned methods of diagnosis and treatment and the cost of special food—for example, for the treatment of glycosuria. Two large collecting organizations help matters materially in the neighbourhood.

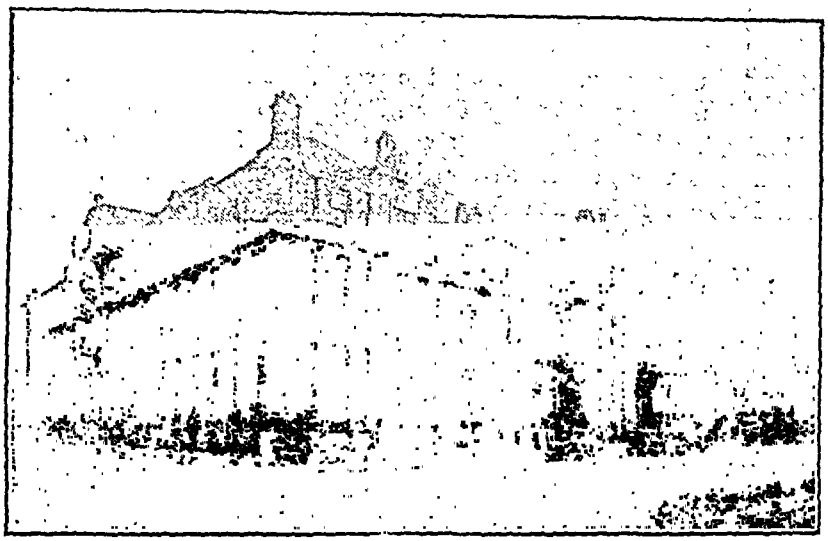
1. *The Manchester and Salford Medical Charities Fund*, formerly known as the Hospital Sunday Fund, collects and annually distributes about £40,000 among the hospitals and a few dispensaries and allied treatment centres; the amount allocated to each institution being calculated on the number of beds and patients, and work done, generally speaking. In addition to collections in places of worship in the two towns

and the neighbouring towns on one Sunday in the year, this fund organizes the Alexandra Rose Day collection, and receives the collections of the students on Shrove Tuesday, and of various sports and entertainments efforts.

2. *The Hospital Saturday Fund*, on the other hand, collects weekly contributions from the workpeople of Manchester and Salford and district in aid of local hospitals and to support its three fine convalescent homes at the seaside. Its annual income has risen to £40,000, and its scheme is to divide equally between hospitals and its convalescent homes up to £20,000 of its income, and 85 and 15 per cent. respectively of any income above £20,000. Until quite recently the amount collected by this fund was only about £20,000, which compared very unfavourably with the sums found by the working classes in some other towns in 1927, which are set out in the accompanying table.

Town.	Total Ordinary Expenditure.	Total Ordinary Income.	Workpeople's Contributions.
	£	£	£
Birmingham ...	275,501	263,100	48,741
Glasgow	375,454	359,502	85,805
Leeds	132,653	115,398	39,867
Leicester	79,295	86,202	27,384
Newcastle	124,471	120,643	46,716
Sheffield	135,476	133,881	87,399
Sunderland	51,762	52,701	28,160
Liverpool	217,576	213,743	16,378
Manchester	350,000	320,000	20,000

The organization for collecting the workpeople's contributions in Manchester and Salford is much more efficient now than it used to be, and with proper representatives on the committees of the recipient hospitals there is a better prospect of this fund becoming as worthy of our district as that of Sheffield is of its neighbourhood. It would be interesting to hear the experience of hospitals receiving so much workmen's support on the admission of patients: whether a right is claimed for treatment by subscribers irrespective of the urgency of their ailments as compared with the urgency of the ailments of the non-subscribing voluntary hospital patient.



Photograph by] SALFORD ROYAL HOSPITAL. *[Allied Newspapers, Ltd.*

Manchester Royal Infirmary.

The Manchester Royal Infirmary is the premier hospital in the district, both in length of service to the sick and in its extent. The small "cottage" in Garden Street, in which it began its life, is still standing, almost in unchanged state, in a wilderness of modern buildings which tower over a narrow canyon of a street still, in name, reminiscent of horticulture in bygone days. Its staff was one matron, one maidservant, one porter (an unruly one too), with 75 in-patients in the first year. From this garden plot, with various transplantations and graftings, has grown the present Royal Infirmary with its 750 beds, 23 resident medical staff, 233 nurses, 21 porters, 141 domestic servants, and 8 administrators; and its 13,000 in-patients.

It was founded by Charles White, a remarkable gynaecological surgeon, who, in 1773, said nearly all that matters about the nature of puerperal fever, and the means to be taken in its prevention—three-quarters of a century before Semmelweis said much the same. White published other original matter which is referred to in other writings. Medical students were admitted to the hospital in 1758 as apprentices, and this was the beginning of our present medical school.

The main building of the present Royal Infirmary is situated one and a half miles from the site of the building in Piccadilly, which was the centre of the clinical interest of the last meeting of the Association in Manchester in 1902. The land on which it stands was provided by the Whitworth trustees through the University, and was the most suitable space large enough not only for doubling the accommodation provided at Piccadilly for patients, and for the modern laboratory means of diagnosis and treatment, but also for the needs of the large number of medical students who attend there.

It is built on the pavilion plan, with eleven blocks for patients—four for medical and seven for surgical cases—with, in all, approximately 600 beds. Much opposition was made to removal from the centre of the town, where it had as fine a site as any hospital could wish for, and where it was before the eyes of the public and of all potential subscribers and benefactors; and it was only on condition that a central branch hospital should be erected close to the old site to deal with the numerous accident cases that the trustees consented to the main hospital being put on the south side of the town, somewhat remote from the scene of its 150 years' activities. Accordingly its Central Branch Hospital, with accommodation for 60 in-patients as well as for dealing with accidents, was built in Roby Street, close to London Road Station, within 300 yards of the Piccadilly site.

Ever since 1758 medical students have received their undergraduate clinical instruction (except in midwifery and, this century, in fevers) at the Royal Infirmary. Women students are admitted for their training. Whilst all the undergraduate teaching is carried out at the Royal Infirmary, most of the other hospitals take part in the postgraduate teaching which is arranged by the University.

The Barnes Convalescent Hospital at Cheadle, Cheshire, with 132 beds, affords a great relief to the overworked parent institution, inasmuch as suitable surgical cases can safely be removed there by ambulance after operation before they are fit for treatment at home.

A fourth hospital belonging to the Royal Infirmary trustees is the Cheadle Royal Mental Hospital. It provides accommodation in two large main buildings and several villas for 300 patients, and stands in its own grounds of two hundred acres. All patients pay according to their accommodation, and any surplus of income over expenditure is invested in further improving the hospital and in caring for the needs of the patients.

The Royal Infirmary has suffered for some years from want of space for its nurses and domestic staff, but it is actively meeting this need by building a new nurses' home in York Place, a quiet backwater off the main road, and in immediate contact with the present Infirmary grounds.

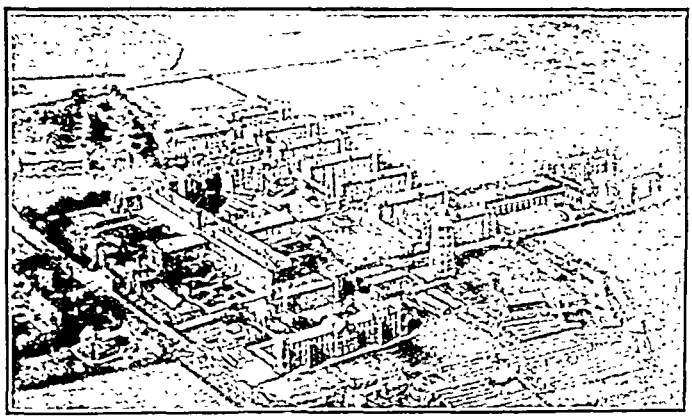
Adjoining the Royal Infirmary, and all on a plot of land about 400 yards square, are the St. Mary's and the Royal Eye Hospitals, the Christie Cancer Home, and the public health and pathological laboratories of the University.

St. Mary's Hospitals for Women and Children (281 beds).—This is the next oldest charitable foundation in the town, the hospitals being founded in 1790 by Charles White and the three Jacobite surgeons—the Halls, father and two sons. Charles White, like many another strong man, liked his own way, and when he could not get it in a quarrel with the trustees of the Manchester Infirmary in 1790, with his followers he crossed his Rubicon—the Irwell in this case. But, instead of advancing on the enemy, he retreated into Salford, and there founded

a rival hospital called the Lying-in Charity, which eventually developed into the present St. Mary's Hospitals. The seceders took a private house, and began attending for the delivery of poor women at their own habitations and for giving them advice and supplying them with medicines. The hospital met a need, moving from time to time to larger premises, and finally amalgamated with the rival Southern Maternity Hospital. In its two fine buildings it now carries out the good work which arose out of an ill breeze. The maternity work of the hospitals, practical and educational, is carried out in the Whitworth Street Hospital. The High Street Branch, adjoining the Royal Infirmary, was the result of the absorption of the rival Southern Hospital, which a large sum of money from Mr. Manasseh Gledhill induced. It is reserved for gynaecological work and for diseases of children.

The Royal Eye Hospital (148 beds) has over a hundred years of work to its credit. It adjoins the Royal Infirmary with a private doorway between the grounds of the hospitals. By arrangement, all eye cases going to the Infirmary that require in-patient treatment are dealt with in the Eye Hospital, and the Infirmary takes over suitable cases from it for in-patient treatment.

Ancoats Hospital, in about the most thickly populated and most unhealthy part of Manchester, was founded in 1827. It is in the centre of a district in which are some of the largest and finest cotton mills of the world, and many engineering works, and it struggles manfully with its heavy accident and general work. A handicap in the matter of financial support is the fact that it is not on any main road where it can be seen by potential subscribers; but in spite of this it is well supported by employers and others, and its income is well up to, if not above, expenditure. Several generous benefactors have provided funds for necessary extensions and for a fine convalescent home in Cheshire. Special attention is paid to orthopaedic surgery in its children's ward.



WITHINGTON POOR LAW HOSPITAL, WITH PAYING WARDS IN THE FOREGROUND.

The Victoria Memorial Jewish Hospital (62 beds) is situated in a quarter of the town in which many Polish and Russian Jews live, and, whilst it specially meets the needs of its own race, is non-sectarian and admits patients of any creed. It is the youngest of our general hospitals, having been founded as recently as 1904.

Salford Royal Hospital has just completed its hundred years of work. It is well situated in a thickly populated district on the broad highway to the North and on a good open site. The extent of its work can hardly be fully gauged even by its handsome frontage, for it has 263 beds in wards out of view from the main road. It is the only voluntary hospital for a town of 250,000 inhabitants, whilst Manchester, for three times the population, has fifteen, a fact which shows how closely the two towns are associated in common interests. The Manchester hospitals receive many Salford patients. A genito-urinary department is a special feature of Salford Royal's general service.

The Royal Children's Hospital, Pendlebury (220 beds), thus best known, is another hundred-year-old institution. The busy out-patient department is in a congested district of Manchester, but all cases needing in-patient treatment are sent to its fine hospital four miles out of town to the north, and in what is at present an open district. Town-planning schemes are, however, likely to close in on it, but in its breezy situation it cannot be harmed to any great extent.

The Ear Hospital (24 beds) has been in existence for seventy-five years. It is situated a mile to the south of the centre of the town, and is rather out of sight. It sadly needs funds for the building of premises more worthy of the work it does than those it now occupies.

The St. John's Hospital for Diseases of the Ear (11 beds) is of much more recent foundation. It is in St. John Street, in the centre of the town.

The Northern Hospital for Women and Children (73 beds) carries out its work in a thickly populated quarter of the town much favoured by the Jewish race of hospital class. Its present accommodation is inadequate for the needs of the hospital, and plans are prepared and subscriptions being sought for a new building to be erected on land a mile further to the north of the present institution.

The Manchester Babies' Hospital (80 cots), founded but fifteen years ago, is the infant charity of the town. It well meets a great need, and is thriving on adequate financial sustenance. The Manchester Corporation fosters 30 of its 80 cots.

The Hospital for Diseases of the Skin (54 beds) was founded in 1884 to take over the out-patient treatment of diseases of the skin from the Manchester and Salford Lock and Skin Diseases Hospital, founded in 1818. It has ever been an advancing institution. In 1901 it opened a department for treatment by Finsen light and x rays, being the first hospital in England, after the London Hospital, to do so. Its present handsome building in the centre of the town was opened in 1906. About 10,000 new patients, with over 70,000 attendances, are seen yearly from all over the neighbouring districts.

St. Luke's Hospital (39 beds) is the present representative of the hospital from which the above-mentioned hospital developed for diseases of the skin. It is an approved institution under the Public Health Regulations (1916), and is the chief hospital for the treatment of venereal diseases in the district. The general hospitals of the towns also have special venereal diseases clinics under the same regulations.

The Hospital for Consumption and Diseases of the Throat and Chest (155 beds) was at the date of its foundation (1875) one of the few hospitals in England devoted to the treatment of consumption. It has an out-patient department in the centre of the town, a hospital at Bowdon, Cheshire, and the Crossley Sanatorium at Delamere, Cheshire. It has a working agreement with the Manchester Corporation for the treatment of tuberculosis. Some of the honorary staff receive remuneration for this public health work.

The Christie Cancer Home (34 beds) and the *Radium Institute* (2 beds) work closely together in the treatment of malignant disease, and there is a prospect of amalgamation of the two institutions, with full recognition of the generosity of the late Sir Edward Holt in making the Radium Institute possible.

The Dental Hospital is situated close to the University, with which it is closely affiliated for teaching purposes. It has no beds, but a large out-patient department at which over 12,000 persons attend yearly.

Two small but very valuable hospitals, not supported by voluntary subscriptions, may be referred to.

The Gaskell Memorial Home, which was established in memory of the daughters of Mrs. Gaskell the novelist, and which provides nursing home accommodation at a cost of 3 guineas a week.

The Stretford Practitioners' Hospital, for the care of patients of moderate means, is administered by the local profession on lines approved by the British Medical Association. Though it has been in existence only a few years, it is extending its successful activities as rapidly as income will allow.

Lack of space prevents reference to other institutions situated away from the town; these will be noticed in the *Book of Manchester*.

THE CORPORATIONS' HOSPITALS.

The medical officers of health of the two towns have large hospital accommodation under their supervision for infectious and tuberculous diseases. In Manchester there are:

1. *Monsall Hospital* (600 beds) for infectious diseases, and *Clayton Vale* (60 beds) for small-pox.
2. *Baguley Sanatorium* (330 beds) for intermediate and advanced pulmonary tuberculosis.

3. *Abergele Sanatorium*, with at present 50 beds for adults and 10 for children in early stages of tuberculosis. Plans are prepared for extension to accommodate 210 more patients with pulmonary or non-pulmonary tuberculosis.

4. *Crossley Sanatorium, Delamere.* By arrangement with the Manchester Hospital for Consumption 80 beds are retained for pulmonary tuberculosis.

Other non-pulmonary tuberculosis cases are sent to special hospitals at Oswestry, Frimley, and Barrowmore (in all about 200 beds).

In Salford there are:

" " " *pital* (300 beds); 224 of the beds are for and 66 for advanced pulmonary tuberculosis.

2. A small-pox hospital at Prestwich with 44 beds.

3. *Nab Cop Sanatorium*, Marple (120 beds), for early tuberculosis.

4. A municipal maternity home and babies' hospital, with 10 beds for mothers and 18 cots for babies.

UNION HOSPITALS.

The large union hospitals play a very important part in our modern life. They have all the modern facilities for scientific laboratory diagnosis, for electrical, artificial light, sunlight, and massage treatments, and in addition to their permanent staff are visited by consultants for all special ailments, who receive honoraria varying in amount according to the work done by them. The Manchester hospitals have wards in which paying patients are treated and visited by practitioners of their own choice, and for whose payment they are responsible. These beds meet a great need, and are well occupied, especially for surgical work.

At the *Crumpsall Infirmary* a whole pavilion of six wards (100 beds and 60 cots) is devoted to maternity, ante-natal, and post-natal work, in which over 1,000 births are dealt with annually. In addition to provision for massage and electrical treatment a new wing, opened in 1927, has three operating theatres, two of which, with the anaesthetizing room, are lined by vitrolite. The daylight from the domed ceilings enters from the north; artificial light is provided by a scialitique lamp in No. 1 theatre, and a "no shado" lamp in No. 2 theatre. No. 3 theatre has dark panelling for its walls, and dark blinds to its windows, so as to be utilizable as a dark theatre for special cases. The flooring in all the theatres is of rubber, and the equipment generally is of the most modern description. The three theatres are arranged around a vestibule at the end of the building, and large doors give easy access from one to the other or to the vestibule.

At *Booth Hall* a special feature is the provision which is made for the treatment of children with heart disease.

In Salford 1,000 beds are not enough to meet the demands of the Poor Law hospital patients, and further accommodation is to be provided.

PAYING PATIENTS.

The need for beds in hospitals fully equipped for all modern methods of investigation and treatment is being more and more felt in England. Their success has long been demonstrated in America. It seems rather anomalous that the hospital class of patient should be better provided for in this way than those who subscribe to the hospital, and can afford to pay moderately or even well for a similar proper investigation of their ailments. In Manchester the following hospitals are meeting, with a greater or lesser number of beds, such needs of the better-class patient: the Royal Eye, St. Mary's, Ancoats, Consumption, Salford Royal, the Northern, and the Radium Institute.

MEDICAL WOMEN'S INTERNATIONAL ASSOCIATION.

SECOND QUINQUENNIAL CONGRESS.

THE second quinquennial congress of the Medical Women's International Association was held in Paris from April 10th to 15th, and was attended by some 270 medical women, representing the following countries: Austria, Belgium, Bolivia, Canada, Denmark, France, Germany, Great Britain, Hungary, India, Italy, Japan, Norway, Poland, Spain, Sweden, Switzerland, United States, and Jugo-Slavia.

During the course of the congress the delegates visited various hospitals and institutions, including the Clinique Baudelocque (Maternité), the Hôpital de la Salpêtrière, the Institut Pasteur, and the Institut du Radium de l'Université de Paris. Ceremonies of welcome and hospitality included a reception at the house of Madame Thuillier-Landry, a banquet given by the National Association of French Medical Women, a reception at the Palais du Luxembourg by M. Paul Doumer, president of the Senate, and at the Hôtel de Ville by M. Georges Lemarchand, president of the Municipal Council. By permission of the League of Nations all the meetings were held at the International Institute of Intellectual Co-operation. Great Britain was represented by thirty-five medical women from all parts of England and Scotland, and the very large attendance of French medical women bore witness alike to the progress of the Association Française des Femmes Médecins and to the increase of medical women in France during the last generation. When the association met in London in 1924 Lady Barrett was elected president, Dr. Jane Walker treasurer, and Miss Martindale honorary secretary, each for five years, this being the period prescribed in the constitution. Other British members of council taking part in the present congress were Dr. Catherine Chisholm, president of the British Federation of Medical Women, and Dr. Letitia Fairfield. Officers elected for the quinquennium 1929–34 were Madame Thuillier-Landry (France), nominated as president, on the proposal of the American and British delegates, and six vice-presidents chosen from the following countries: Great Britain (Lady Barrett), United States (Dr. Tayler-Jones), Germany (Dr. Salzmann), Norway (Dr. Dagny Bang), Italy (Dr. Carcupino Ferrari), Jugo-Slavia (Dr. Nechkovitch Voutchetitch). For the convenience of the president it was decided to maintain the office in Paris during the next five years.

Open sessions of the association, at which the subjects for discussion were sex problems for children and adolescents, and analgesia in midwifery, were formally opened by the Rector of the Paris Academy, to whose speech expressing cordial appreciation of the work of medical women Madame Thuillier-Landry replied on behalf of the International Association. The director of the International Institute of Intellectual Co-operation, welcoming the congress in the name of the League of Nations, emphasized the importance of woman's work in connexion with the League.

Sex Instruction.

At the sessions dealing with sex instruction for children and adolescents Miss Martindale (British Rapporteur General) presented her report summarizing fifteen papers on this subject submitted from Denmark, Germany, Great Britain, New Zealand, Norway, and Sweden, in reply to a questionary which had been sent out from the central office some months previously. Papers from Great Britain were contributed by Dr. Catherine Chisholm, Dr. Letitia Fairfield, Dr. Scoresby-Jackson, Dr. Octavia Wilberforce, and Dr. Lilian Wilson. Similar papers from France, Italy, Hungary, Poland, Switzerland, and Jugo-Slavia were epitomized in a report submitted by Madame Montreuil-Straus, the French Rapporteur General. Following a discussion, in which Great Britain was represented by Dr. Letitia Fairfield and Dr. Doris Odlum, the congress formally adopted the conclusions as summarized by the rapporteurs. Briefly these conclusions are as follows:

1. That sex instruction in some form should be given, though preferably not under that name.
2. That to very young children elementary sex instruction should be given by parents.
3. That during school life biological teaching concerning the facts of reproduction should be included in the routine teaching of nature study.
4. Arising out of 2 and 3, that parents and teachers should themselves be educated in sex matters.
5. That inasmuch as physiological knowledge, however widely imparted, does not necessarily influence conduct, sex education of adolescents should be supplemented by instruction in ethics to ensure control of the instinctive impulses and their subordination to a social ideal.
6. That it is the doctor's special function to deal with the pathological sides of the question—namely, to give advice as to treatment and care of difficult or abnormal children, and instruction on the subject of social diseases.

Analgesia in Midwifery.

The reports on analgesia in midwifery summarizing the papers sent in from various countries were presented by Dr. Kunckel of Germany and Dr. Nechkovitch Voutchetitch of Jugo-Slavia; Great Britain had contributed papers by Dr. Lily Baker, Miss Basden, Miss Bloomfield, Dr. Janet Gray, Professor McIlroy, and Dr. Joan Rose. Among the anaesthetics discussed were chloroform, ether, nitrous oxide, lumbar anaesthesia, twilight sleep, pernocton, avertin, and somnigen. In the published reports the view was expressed that "at present no absolutely safe anaesthetic is known to us, and it would be the task of obstetrical science to discover one." Dr. Clara Kary (Berlin) mentioned the method favoured by most of the English authors—namely, morphine for the initial stages, followed by *narcose à la reine* during the birth of the head. Miss Lily Baker (Bristol) recommended, in addition to morphine, the use of omnopon and heroin, and, if possible, scopolamine and atropin. In operative cases she advocated the use of ether, and, only when this is contraindicated, lumbar or sacral anaesthesia, or nitrous oxide and oxygen. Dr. Janet Gray (London) favoured chloroform, or a mixture of opium, bromide, and chloral hydrate, or chloral hydrate in the first and chloroform in the second stage of labour. Miss Alice Bloomfield (London) stated that the intermittent administration of chloroform to the so-called "obstetrical degree," with a deepening of anaesthesia at the actual time of birth, is the method of choice and general usage in England. Professor Louise McIlroy held that the best analgesics for the first stage of labour were morphine and its derivatives, in conjunction with, and later replaced by, small doses of scopolamine. She had also found chloral hydrate, bromide, and adrenaline useful. For the second stage she recommended nitrous oxide and oxygen as the best anaesthetic. She stressed the importance of administering to the patient the appropriate psychological suggestion, and emphasized the need for establishing in the patient complete confidence in her medical attendant, who should promise her relief from pain in so far as this was possible and consistent with safety for herself and her child. The discussion on the report was opened by Lady Barrett, who was followed by Professor McIlroy, Dr. Bertha Van Hoosen, and other delegates.

Belgium.

[FROM AN OCCASIONAL CORRESPONDENT.]

The League of Mental Hygiene.

A MENTAL hygiene league was inaugurated in Belgium in 1922; it has several provincial sections. The special dispensaries which have been opened co-operate closely with the mental hospitals and with the courts of justice. They constitute, moreover, centres for the supervision of mental cases, and these patients are no longer left to such help as may be given by voluntary associations. Mental hygiene is a vast subject, and includes in its survey such different departments as education and medical treatment. The dispensary assumes primary responsibility for procedures such as investigations of the family history and social circumstances, which in the hands of less experienced workers involve serious expenditure of time. Thanks to the dispensaries medical officers of mental hospitals are reasonably assured that a patient thought to have been cured can go back to a favourable environment, continuing to attend a dispensary for as long as is thought necessary. Only since November, 1926, has the treatment of mentally deficient children been conducted at the dispensaries; the problems which it presents are at times social as well as medical. Three stages have to be considered in this respect. There is firstly the period before the child goes to school; it is a time of adaptation to life in which it is occasionally necessary to intervene very actively from the prophylactic point of view. Such children present a minimum of mental symptoms, except when the graver mental abnormalities are present, and physical signs are relatively much more prominent. The second stage is that of school life, when the child has to adapt himself to this particular environment, and intellectual progress is concerned. The disorders which come up for treatment are now fully developed. The third stage is the post-educational one of adaptation to social life; it is also the stage of delinquency. As regards the selection of these cases the children are brought by their parents, by the health workers in schools and industrial organizations, or by the judicial authorities of children's courts. One of the chief advantages of the system is that very often these children can remain in the family circle, with moral and material benefit, apart from what the hospital or dispensary can give. The part played by these mental hygiene dispensaries in dealing with delinquents is of similar importance.

Health Administration in the Belgian Congo.

The health department of the Government of the Belgian Congo has just published an interesting and very detailed report on the results achieved by the new medical administration, which came into existence in 1922, and was characterized by the concession of autonomy and the creation of provincial medical services. In framing its organization advantage was taken of the experience gained in these matters by the parallel British and French administrations, and the distinctive principles of both have been combined in the Belgian scheme. The British policy is to establish treatment centres to which patients are brought; in this way medical aid is provided for the greatest possible number of those suffering from all varieties of diseases. The French plan utilizes the native medical service; it aims at hunting out the various endemic and epidemic diseases and at the promotion of health measures in the various centres of population. In 1925 the Belgian Government medical officers were solely responsible for the treatment in hospitals and dispensaries of 85,000 cases of trypanosomiasis, 10,045 cases of syphilis, and 33,754 cases of yaws. The steady increase in the financial commitment of the colony in connexion with improvement of the general health is shown by the following figures, which indicate the sums devoted to the provision of drugs and equipment. An expenditure of 250,000 fr. in 1914 rose to 562,000 fr. in 1919; to 2,250,000 fr. in 1921; to 3,400,000 fr. in 1922; to 4,650,000 fr. in 1923; to 9,000,000 fr. in 1925; to 70,000,000 fr. in 1928; and to an estimated 79,000,000 for the current year. Vaccination against small-pox has been a primary concern of the Government since a vaccination service was inaugurated in 1895, and all natives were required to come for periodical re-vaccination. Lymph prepared locally was found to be ineffective, and, consequently, large supplies have since been sent regularly from Brussels. Great benefit followed the introduction of a dried vaccine which gives excellent results but imposes a very heavy financial strain. The outstanding disease as regards Europeans is malaria with its complications; an antimalarial association has been started at Elizabethville, and a second one at Leopoldville. Trypanosomiasis is certainly the most severe of those diseases which ravage the native populations of the Congo; it has been made the objective of an intensive campaign, the history of which is detailed in the report. The total number of sick persons traced, examined, and treated is very high; many leper asylums have also been built. Among other matters the report discusses the work of rural dispensaries, training colleges for native medical assistants, schools for native midwives, child welfare, and medical charities for the native population. As regards the medical staff there are actually 135 medical officers on the official register of the colony; the various industrial organizations are responsible for the addition of about 130 other medical officers.

A New Degree in Anthropology.

The University of Liège has instituted a diploma and a doctorate in anthropological science. The qualifying studies comprise (1) physical anthropology, (2) human anatomy, (3) general and special human physiology, (4) ethnography and ethnology, (5) human geographical distribution, (6) the principles of sociology, (7) the elements of the science of language, (8) human palaeontology, (9) prehistoric archaeology, (10) geology of the Quaternary Period.

England and Wales.

Dinner to Lord Moynihan.

ON April 19th the University of London Medical Graduates' Society gave a complimentary dinner to Lord Moynihan, F.R.C.S., at the Hotel Metropole, Leeds. The guest of honour was accompanied by Lady Moynihan. Sir StClair Thomson, president of the society, was in the chair, and in his speech proposing the health of the guest mingled a vein of playful badinage with terms of sincerest admiration. He drew a picture of Lord Moynihan as the great teacher and inspirer of the young surgeon, always ready to show the minute details of his wonderful craftsmanship. The whole profession was under a deep obligation to him, and this not only because he encouraged others to aspire to a great tradition, but, by the charm of his culture and the width of his interests, he had shown that a medical man was not necessarily a mere "pill-monger" or a "sawbones." Truly, Lord Moynihan had raised the status of the profession throughout the world. The toast was drunk with great enthusiasm. Lord Moynihan, who was greeted with cheers on rising to reply, said, in banter, that all his life he had been endeavouring to chase, but without ever catching up with, the defects of belonging to the University of London; for the university in his day was not a university at all in the strict sense, but merely an external examining body. In his view a university was not primarily a place at which to acquire knowledge, though this was often regarded as its chief function. Much more vital was the impact of mind upon mind among undergraduates, the collision of differing temperaments, and the moulding of a shapeless, plastic mass into something capable of being recognized as a crystal of many facets. Speaking of his peerage, Lord Moynihan said he had been overwhelmed by the friendliness of the acclamation that had come from all over the world. This acclamation, he realized, was not relevant entirely to himself, but was an honour to the profession as a whole, and, in interpreting this honour, he would use it to the utmost of his power for the good of the profession and all it stood for. Dr. Rhoda Adamson of Leeds, to whom the success of the dinner was in great measure due, in a few happy words in appreciation of Lady Moynihan, proposed her health, to which the company very heartily drank. The dinner was a very influential one, no fewer than twelve cities and towns having sent representatives. Among those present were: Mr. A. Richardson, Mr. C. Oldfield, Mr. H. Collinson, Dr. R. A. Veale, and Mr. A. L. Whitehead, of Leeds; Mr. Harry Platt of Manchester; Professor W. Blair Bell of Liverpool; Professor W. Billington of Birmingham; Dr. W. Edgecombe and Dr. W. B. Watson of Harrogate; Mr. J. H. Cobb and Mr. E. F. Finch of Sheffield; Mr. E. M. Hainworth of Hull; Dr. Dorothy Hare, Mr. W. McAdam Eccles, and Mr. Herbert Tilley from London. The University of London Medical Graduates' Society is steadily increasing its membership, and now has a large number of graduates overseas as members. The annual London dinner will be held on Tuesday, May 7th, at 6.45 p.m., at the Langham Hotel, before the reception that evening to the members of the International Congress of Military Medicine and Surgery.

Extension of the Guest Hospital, Dudley.

The board of management of the Guest Hospital at Dudley are appealing for £50,000 for the enlargement and equipment of this institution, which was founded in 1871. In order to obviate interference with the working of the hospital during the reconstruction it is proposed that the extension should be conducted in four stages, the first of which is the provision of a ward unit with two stories, and accommodating twenty-four beds and three single-bed wards. The next stage will be the replacement of the old laundry and boiler house by a new one; subsequently a further ward unit of two stories will be built, and certain portions of the existing hospital will have to be remodelled. In connexion with this extension scheme an illustrated pamphlet has been issued describing the development of the hospital. It is recalled that the present buildings were made available by the late Earl of Dudley for the accommodation of workers who became blind in limestone pits; they were originally designed for almshouses, though never used as such to any extent. They were altered by the late Earl of Dudley to serve as a hospital, and endowed by the late Mr. Joseph Guest, who presented £20,000 for this purpose. In 1912 the out-patient eye department of the Dudley Dispensary was transferred to the Guest Hospital, and it is mentioned that during the last five years there have been over 52,000 attendances of ophthalmic patients at the out-patient department and 2,000 cases admitted to the wards. The x-ray department has recently acquired additional plant at a cost of £500. The Guest Hospital is situated in a densely populated industrial area, and its resources have been severely taxed in recent years by the increase in the population and of the number of road accidents. During 1928 over 2,000 patients were treated in the wards, and there were more than 55,000 out-patient attendances. There is a long waiting list, but it is hoped that the extension, which will eventually add eighty-five beds to the hospital, will enable it to deal more adequately with the local requirements.

Royal Westminster Ophthalmic Hospital.

A report has been issued on the first three months' working of the private paying rooms at the Royal Westminster Ophthalmic Hospital, which were opened in the new building in Broad Street, Holborn, on January 1st of this year. The average stay has been three weeks, and the average cost to the patient £15 15s., exclusive of the surgeon's fee, which is a matter of private arrangement between himself and his patient. Only in one case was it necessary to charge a small additional fee for the services of a special nurse. All the other cases were nursed entirely by the hospital's private nursing staff working under the supervision of two resident medical officers. Fourteen of these private rooms are available at the hospital. They are all single rooms, and the paying wing is entirely cut off from the public wards, having its own theatre, kitchen, and sitting-room.

Scotland.

Small-pox Outbreak in Glasgow.

AN outbreak of small-pox originated on board the Anchor liner *Tuscania* on her homeward voyage from Bombay. Seven members of the crew were landed at Glasgow and confined in Robroyston Hospital; the authorities have kept under observation in the city some 300 persons who travelled on the ship and are possible contacts with infected cases, while the 600 passengers who were landed at Liverpool and Glasgow are also being watched by health authorities in various parts of the country. Arrangements were made, after the cargo of the liner was discharged, to fumigate the whole ship. A large supply of vaccine lymph had been taken on board at Marseilles, and every person on board had been vaccinated. Up to April 12th the number of patients in hospital affected by small-pox was 13, of whom 12 are members of the crew and 1 a passenger. The disease appears to be of a severe type in several cases. On April 15th there were 18 cases in Robroyston Hospital, and 1 case was subsequently admitted to the Aberdeen City Hospital, suffering from small-pox. So far as Scotland is concerned, however, vaccination and tracing of contacts appear to have successfully controlled the outbreak.

Livingstone Flag Day in Scotland.

Arrangements have been made to hold a flag day in Edinburgh, Glasgow, and other Scottish towns on April 27th, for the purpose of raising funds in connexion with the memorial to Dr. David Livingstone, the African explorer. The memorial and museum are to be set up at his birthplace in Blantyre, Lanarkshire, and will be opened early in July of the present year. It may be recalled that the explorer qualified in medicine and took the licence of the Faculty of Physicians and Surgeons at Glasgow in 1840, and that during his travels he took much interest in methods of medical treatment applicable to tropical regions. His journals record many observations on the uses

of various drugs and other medical procedures. In the middle of the nineteenth century, when the use of the clinical thermometer had not yet become one of the commonplaces of medicine in connexion with fever, Livingstone made extended observations with this instrument, using the ordinary thermometer both for taking atmospheric temperatures and that of patients. His advocacy of the wet pack contributed to the more general adoption of this method of reducing high temperature. In regard to febrifuges, he noted several plants which were in use in Africa in place of quinine, and which might be used when the latter drug was not available. He is generally credited with having been one of the first persons to point out that the action of quinine was greatly helped by the previous administration of a powerful purgative, using for this purpose a "rouser" containing 8 grains of jalap resin, 8 grains of rhubarb, and 3 grains each of calomel and quinine.

Edinburgh Dental Hospital and School.

The thirty-seventh annual meeting of the Edinburgh Dental Hospital and School was held on April 16th. Dr. William Guy, dean of the school, presided. The report shows that there were 112 students attending the hospital, and that during 1928 21,977 operations were performed. The total income was £4,975, of which £2,791 went to the school and £2,184 to the hospital, leaving a balance of £665. It was pointed out that they had not yet reached the limit of the increased expenditure occasioned by extensions to the school, and that, though the finances were entirely satisfactory, it was not yet possible to forecast accurately what the future would be. Mr. J. B. Clark, who moved the adoption of the report, pointed out that more than half the total number of operations had been undertaken for preservation of the teeth, and that the hospital was making an enormous contribution to the maintenance of the good health of the community. In the course of the history of the school, about 850 highly qualified dentists had been turned out. He believed that if the public realized the great contribution that this hospital made to the health of the community it would receive more ample support, so that a larger part of the fees of students could be released for increasing and extending facilities for teaching.

Ireland.

Ireland's Freedom from Small-pox.

THE Secretary for the Department of Local Government and Public Health, in a recent statement in connexion with small-pox, claims there is a complete absence of the disease in Ireland, which he attributes to the enforcement of compulsory vaccination. He announced that the department had for a long time anticipated the appearance of small-pox. In 1923 a memorandum was issued summarizing the measures for promptly dealing with any case that might arise. The questions of infection, supervision of contacts, vaccination, and re-vaccination were all discussed in detail, and these instructions were very familiar, both to medical officers and boards of health throughout the country. All medical practitioners were warned to communicate immediately with the local medical officer of health if there was the slightest suspicion of any case of small-pox. Hitherto time had been lost in some instances by mistaking chicken-pox for small-pox. On the general question of vaccination, it was added, local authorities were most diligently carrying out their duties. The department was most anxious to keep a clean bill of health as regards small-pox, a vital matter in a country which exported foodstuffs, and was undeniably an ideal tourist resort. There had been no outbreak for many years, and the department was fully satisfied that the present organization could cope with any emergency. Dr. Angela Russell, wife of the Dublin medical officer of health, in a health talk on small-pox, which was broadcast recently by 2 R.N., referred to the outbreak on the s.s. *Tuscania*, and the fact that one of the contacts was a Dublin man. Some people, she said, had begun to think that it was harmless because of the mildness of the disease in England since the war; they imagined it had lost its virulence, and they neglected vaccination of their infants to ward off what appeared a mere bogy, because it would entail inconvenience to themselves. Small-pox, she pointed out, was as fatal a disease and as great a scourge to-day as it had ever been. If the people on the s.s. *Tuscania* who had been attacked by the disease had been vaccinated within the last few years not one of them would have been affected. The disease was as common long ago as measles to-day, and the reason it had virtually died down was the practice of vaccination, the one and only preventive and cure for the disease.

The Mosquito Nuisance.

The Public Health Committee of Belfast, having considered the nuisance caused by mosquitos and other insects, has issued a statement, signed by Dr. C. S. Thomson, superintendent medical officer of health, giving the following advice. A vacuum machine is useful to destroy the hibernating female in rooms and outhouses. Burn the contents of the bag; do not put them in the dustbin. Fumigation and the limewashing of walls is also valuable. Pools and puddles should be drained and filled up, and choked-up gutters attended to. For small areas a pneumatic sprayer could be used for spraying casual water with paraffin oil containing 2 per cent. of castor oil. To prevent bites, oil of lavender on the hair or clothes may be tried. As the mosquito frequently bites about the ankles, two pairs of thin socks or stockings are better than one thick pair, and Russian or Wellington boots should be worn in the garden. To protect the face use a 50 per cent. alcoholic solution of thymol, or oil of cloves in lanoline. If bitten, dab on at once a weak solution of ammonia or of washing soda or common soap and vinegar, or apply a cut onion to the sore. If the irritation is severe apply iodine in glycerin. Call a doctor if matters get worse.

Correspondence.

THE DISTRIBUTION OF RADIUM.

SIR,—The issue of the report of the Radium Subcommittee raises in an acute form the problem of the distribution of radium throughout the country, and the question as to whether it is better to distribute radium broadcast to all those who would like to make trial of its use or to concentrate it in centres specially equipped for its service. At the present time the former plan has been adopted, and every hospital throughout the country is fighting for supplies, in the full conviction that if a surgeon only possesses radium he can cure cancer, and in utter disregard of the skill and experience required for its successful use. It is surely high time that someone should utter a warning against the folly of such a policy, and should point out the dangers involved in the inexpert use of this most powerful weapon. Should such a policy still be pursued with the large amounts of radium which will shortly be at our disposal it can only result in disaster and discredit.

If any progress is to be made in the treatment of cancer by radium it is surely essential that it should be concentrated in certain centres, and not distributed broadcast. Four such centres in London, four in the provinces, and one in Scotland ought to be sufficient, although some of them might perhaps be divided for convenience in working. Only in this way can sufficient cases of the same kind be brought together to try out different methods of use, a staff of sufficient experience be assured, and accessory apparatus, such as powerful *x*-ray plants, be available. Each centre should be under one director, who would co-ordinate the work done, and who would have under his control, so far as the treatment of these particular cases is concerned, the whole resources of the centre. The centre would probably be situated in a large hospital, but I do not at all mean that cases should be withdrawn from the care of all other members of the staff and handed over to the director of the centre. Those in charge of the cases would, however, only have access to the resources of the centre in so far as they were willing to act in conjunction with the director, and to place the whole of the notes of their cases unreservedly at his disposal. He, on his side, would see that

they were provided with radium in forms and amounts suitable to the cases, and would advise as to dosage and methods of treatment. This would obviously introduce into hospital work an entirely new element, but the circumstances most certainly demand it.

Around each centre there ought to be subsidiary centres, which would be visited on stated days by experts from the centre itself, and where the local practitioners might have an opportunity of consulting an expert as to the treatment of their cases. This would save fruitless journeys for patients, and would prevent the centre from being crowded with unsuitable cases. It would also make for the early recognition and admission of cases of cancer. The system is at work in France, and is very successful.

At certain of the centres, perhaps at all of them, there should be an installation for the preparation of radium emanation, and perhaps for its supply to selected individual surgeons in the subsidiary centres. Although its use demands the same precautions as that of radium itself, it has the great advantage that it is only of transient value, and that its loss is a matter of small importance. I hold strongly that in no circumstances whatever should any of the radium itself be moved from the centre, as the risk of its loss is considerable. With suitable adjustments precisely the same results can be obtained with emanation, the use of which is in many ways advantageous. In contrast to the views held abroad, I am personally of the opinion that the whole future of radium treatment lies with emanation, from its great convenience and safety, whilst in many cases the fact that it need not be removed after introduction is of vital importance.

At every centre arrangements must be made for the admission and treatment of private patients. It would be intolerable that any individual should be debarred from the services of the centre because he was well off financially. In most cases it will be impossible, and most undesirable, that he should be treated in the centre by his private medical attendant, since we are here dealing with a highly specialized form of treatment, which can only be carried out satisfactorily by those who are constantly engaged in its application. This, of course, cuts clean across all our present ideas of medical practice.

It cannot be too strongly stated that the successful treatment of cancer by means of radium is a matter demanding the most expert knowledge, and that attempts to use radium without that knowledge are unlikely to succeed, and are exceedingly dangerous for the patient. Possibly years hence its use may be reduced to a standardized procedure, but at present we are in an experimental stage, where every consideration of wisdom and policy demands the utmost caution and the closest observation of results.—I am, etc.,

London, W.1, April 22nd. H. S. SOUTTAR.

INQUIRY INTO THE ETIOLOGY OF CANCER.

SIR,—In the *British Medical Journal* of June 16th last an appeal was made to your readers to help in a statistical research into the etiology of cancer by answering a schedule of questions relating to a cancer patient and a non-cancer patient of the same sex and about the same age as control.

The response to this appeal, though somewhat disappointing, was sufficient to justify printing the schedules and starting the investigation, and some medical practitioners have rendered most useful service by their careful work in completing these forms.

In order that sufficient data may be secured, more volunteers are needed, and since many of your readers doubtless did not see or give careful consideration to the first appeal, may I again ask that any who are in touch with cases of cancer, whether in general, specialist, or hospital practice, and who are prepared to devote a few hours to assist in this research, will communicate with me at the Galton Laboratory? Unfortunately it is not possible to offer any kind of remuneration for this service, but I feel sure that there are some who will be prepared to make this voluntary sacrifice of a little time to help in a form of cancer research which can only be carried out by team work.—I am, etc.,

PERCY STOCKS, M.D., D.P.H.,
Reader in Medical Statistics, University of London.

Galton Laboratory, University College, London, W.C.1, April 23rd.

POST-GRADUATE INSTRUCTION IN MIDWIFERY.

SIR,—In the recent discussion upon "The future of maternity services" one of the speakers stated that she "was not aware of any post-graduate facilities for the general practitioner, enabling him to take an intensive course."

During the last two years, St. Mary's Hospital, Manchester, has held such a course during the summer extending over a period of one week, and it is intended to repeat this for the third time commencing on June 15th of this year. There is accommodation for eight qualified practitioners to live in the hospital, and during this week each member of the honorary staff resides in turn in the hospital for twenty-four hours so that he is on the spot to attend to any maternity emergency and hold regular systematic classes.—I am, etc.,

Manchester, April 19th. WM. FLETCHER SHAW.

THE TREATMENT OF ACUTE OTITIS AT PUBLIC SCHOOLS.

SIR,—In the Journal of April 20th (p. 745) "M.D." asks some straight questions about this subject, and from me he shall have some straight replies.

I have seen a good many epidemics of influenza, but never have I seen one which attacked the middle ear so severely as the recent one. Adults as well as children have been the subjects of the attacks. I have no hesitation in saying that as soon as the patient complains of earache the membrana tympani should be examined at least night and morning; if it is injected, and more especially if bulging in the slightest degree, there should be no delay in paracentesis. If such early treatment is given the finding of serous pus only will be all the better and the operation justified. Such prompt treatment more often than not is a means of clearing up the affection altogether in a short time, besides which a punctured membrane is much more likely to heal than one which has been allowed to perforate on its own account and which so often results in a chronic discharge, with all its after ill effects.

As to pus in the mastoid antrum, it is just as unwise to leave these cases as it is to do so in acute appendicitis, yet there may be no signs externally, such as swelling or tenderness over the mastoid region. During the recent epidemic of influenza I have opened many mastoid antra, and in all pus was found; these were all cases where the membrane had been allowed to perforate. The difficulty in many of these cases is that one does not see them early enough; this may be due to the fact that the public, and possibly some practitioners, look upon them too lightly in the first instance.

Therefore the answers to both of the questions of "M.D." are in the affirmative.—I am, etc.,

Chichester, April 21st. ARTHUR M. BARFORD.

SIR,—The answer to "M.D.'s" query concerning the treatment of acute suppurative otitis media is in the affirmative, as he very rightly suspects. Nor should there be any waiting till the condition is suppurative, since an early incision in the full drum relieves the *retention pressure* and thus removes the chief factor in infection of any hollow organ. Organisms and infection thrive under pressure. Also the relief of pressure allows the swollen mucosa to subside, thus removing any dam to the antrum or attic contents (which are mucous in the early stages), and discouraging adhesions.—I am, etc.,

London, W.1, April 21st. C. HAMBLEN THOMAS, F.R.C.S.

SIR,—There can be no doubt that there would be fewer "running ears" and "mastoids," with their accompanying complications, if every "gathered ear" was adequately treated at the outset according to ordinary surgical principles—that is, by free incision of the drumhead. Surely it is time that every practitioner recognized the potential gravity of a suppurating ear.

Paracentesis means a "lapping of a body cavity." When applied to the tympanic membrane it is inadequate. There

should be a free and deliberate incision, commencing as high, and extending as low, as possible. The termination of the incision should be slightly curved so as to form a small flap to prevent too early regeneration. It is at the lowest part of every cavity that drainage is most efficacious. A straight incision is very apt to close too quickly. The myringotome should have a very keen edge. An inflamed membrane is acutely sensitive; therefore complete general anaesthesia is needed for precision. In adults I use gas and oxygen.—I am, etc.,

ARNOLD FERGUSON, F.R.C.S.Ed.,
Aural and Ophthalmic Surgeon,
Jersey General Hospital.

April 22nd.

THE INTRACUTANEOUS TUBERCULIN TEST.

SIR,—My view that Professor Lyle Cummins's description of the lesion produced by the intracutaneous tuberculin test (April 13th, p. 707) is inaccurate is strengthened by the fact that in his own case the lesion as an induration lasted many weeks; the lesion is inflammatory, and not oedematous. No one but Professor Cummins could suggest that the lesion he describes indicates the need for treatment. No one who knows my work and views can accuse me of ever having relied upon the intracutaneous test for the diagnosis of tuberculosis in human beings; "as a criterion in diagnosis" with a view to treatment, I neither use it nor recommend it. I am a firm believer in the value of the subcutaneous method of Koch as a means of determining whether in a case of obvious infection specific treatment is wise.

The failures of the system carried out in hospitals and sanatoriums by physicians and tuberculosis officers are strikingly shown by the charts on my table, taken at random. There are 38 patients: 24 with tubercle bacilli in the sputum, 3 patients, sent by ophthalmologists, suffered from episcleritis proved by proper tests to be tuberculous, 1 case of phlyctenular conjunctivitis, 2 cases of tuberculous disease of the skin, 1 case of tuberculosis of a digital joint, 2 cases of pleurisy, diagnosed by tuberculin as tuberculous, and 1 case of severe haemorrhage (pints). Thus, out of 38 cases, 34 are certainly cases of tuberculosis needing treatment. There remain only 4 out of 38 in which the diagnosis could be doubtful. If Professor Cummins had seen these four cases before and after treatment he would hesitate to question my skill in diagnosis and treatment by means of tuberculin. I used Koch's method of diagnosis, and not the intracutaneous test.

In my first book, *Treatment of Consumption* (p. 70) (1903), I criticized the somewhat ancient statistics of Naegeli and Burkhardt, quoted by Professor Cummins. Naegeli's generalization was based upon post-mortem examinations of 391 hospital patients from the poorest parts of Zürich, of whom 110 died of tuberculosis; Burkhardt's generalization upon 1,262 patients of the industrial classes, of whom 465 died of tuberculosis. These statistics show that in the hospitals studied *one death in every three was due to tuberculosis*. At the time the death rate in Zürich was far greater than the death rate in London.

Professor Cummins says that "these findings accord well with my [his] 90 per cent. of 'positives' to 1 in 1,000 [*sic*] tuberculin in healthy adult males." He actually infers that the positive reaction is almost as common in the healthy adult population of England as it was in the hospital population of Zürich and Dresden, when one death in every three was due to tuberculosis. Obviously Professor Cummins's method of testing the value of the intracutaneous reaction has led him into very serious error, and in the public interest I am bound to say so. Dr. Burkhardt, in his article, writes these pregnant words, which Professor Cummins has entirely ignored:

"I have already made it clear that from such hospital material, drawn mainly from the urban working classes, precise statistical generalizations and conclusions as to the incidence and frequency of tuberculosis among the general population are to be made only with extreme caution." (*Zeit. f. Hyg. u. Infectionskr.*, 53–54, 1906.)

Nor is this all. It seems that Professor Cummins has chosen these musty statistics and ignored those of recent date, to which I have referred in my last book, *The Principles of Immunity in Tuberculosis*. The statistics of Hart (*Pathologische Beobachtungen während des Krieges* usw.) show tuberculous changes in post-mortem examinations in 34.2 per cent., those of Rössle in 33 per cent., and those of Oberndorfer in 10 per cent.; Hart's statistics are the work of a master.—I am, etc.,

W. CAMAC WILKINSON.

London, W.1, April 15th.

SIR,—As a surgeon I have followed with much interest the correspondence in your columns between Professor Lyle Cummins and Dr. Camac Wilkinson as to the value of the intracutaneous tuberculin test. Neither of them has mentioned the test of Wildbolz of Bern. This test is based upon the principle that the kidney, among its other functions, is capable up to a point of excreting from the blood active bacteria and their toxins without perceptible damage to its normal function—for example, typhoid, dysentery, *B. coli*, etc.

Professor Blum of Vienna recently told me of a case of a young man who consulted him about a swelling of the epididymis. He was able to exclude venereal disease, and his diagnosis was tuberculous infection. This patient visited Wildbolz, who said, after his test, that it was not tuberculous trouble. The patient returned to Professor Blum, who, unbelieving, removed the diseased testis, and found the condition was an infarct, and not tuberculous. Wildbolz claims that his test is specific for active tubercle, and the allergic element of the patient is excluded by preliminary tests with tuberculin.

For the benefit of those who are not *au fait* with this test it is as follows. A specimen of the urine is taken, and is evaporated down at 50° C. to a small bulk. Two to three minims of the clear evaporated fluid are injected intramuscularly, and if tubercle is present there is an active oedema at the site of injection. I have carried out this test in two cases only, and it has proved true. Of course, one is sceptical, but if this test, along with allergic exclusion, is of value, as suggested by the Vienna school, it will be of real importance.—I am, etc.,

BASIL HUGHES.

Bradford, April 15th.

REPRESENTATION AT POST-MORTEM EXAMINATIONS.

SIR,—Without criticism of the procedure in the particular case of the acquittal of a medical man, reported in your "Medico-Legal" column (April 6th, p. 669), may I draw attention to the attempt in recent legislation to secure for accused persons right of representation at post-mortem examinations, and to indicate how in practice it may come to naught.

Section 23 (4) of the Coroners Act definitely states that a medical man accused of neglect or being in any way responsible for the deceased's death shall "not be allowed to perform or assist at any post-mortem," but "shall have the right, if he so desire, to be represented at such post-mortem examination." But the whole section is only applicable "where a person states on oath before the coroner that in his belief" the death was due to or accelerated by the medical man. The trouble arises from the fact that the necropsy is invariably, and rightly, performed before the inquest, at which any statement inculpating the medical man is made, and until such sworn statement is made Section 23 (4) is not applicable.

Sir Bernard Spilsbury rightly places on the coroner the onus of the conduct of the procedure at post-mortem examinations. The coroner has absolute authority, the police act solely as his "officers": until Section 23 (4) is invoked, he could allow anyone to be present at the post-mortem examination, or even to conduct the examination, as no person is technically "accused" till a statement on oath has been made against him. It would perhaps be unwise to allow any person likely to be incriminated to be present, but his representative could be there. It would be well, therefore, for any medical man likely to be accused to ask for permission for his representative to be present. But if this is refused the right to be represented does not arise under Section 23 (4) until the inquest is opened and the post-mortem examination already done: except in

those cases where the inquest is begun, the sworn evidence taken, and the examination is then ordered on adjournment. Usually the first intimation of any charge against the medical man comes out at the inquest, when it is too late for him to avail himself of the right especially provided in the Act of 1926; by then, indeed, he may have already performed the examination himself.

It would be an advantage if the provision of Section 23 (4), conferring on an accused person the right to be represented at a post-mortem examination, could apply even in cases where the accusation was not made on oath, but as an ordinary statement to the coroner's officer.—I am, etc.,

EDWARD F. HOARE, M.D.

Ringmer, near Lewes, April 12th.

PLEURAL ADHESIONS AS A POSSIBLE CAUSE OF ASTHMA.

SIR,—In the literature on asthma to which I have access I can find no reference regarding pleural adhesions in this disease. Osler mentions that the disease may be induced reflexly from the stomach, intestines, or genital organs, or by direct irritation of the bronchial mucous membrane. My edition of Cunningham's *Anatomy* does not even mention the nerve supply of the pleura.

It would be of interest to know if any animal experiments have been performed to discover what happens to the bronchial musculature on stimulation of the surface of the lung.—I am, etc.,

Crewe, April 18th. W. L. ENGLISH, M.B.

THE ORIGIN OF "QUARANTINE."

SIR,—Under the caption Nova et Vetera in your issue of January 19th (p. 122) appears an interesting article by Dr. F. G. Clemow with reference to the origin of the word "quarantine" and the probable reasons which led to the adoption of a period of forty days as one suitable for that purpose. As so often happens, the study of the origin of words in our language opens up a fascinating field for investigation and speculation.

It would seem that the determination of a fixed period of forty days, or years, is one that has been transmitted from remote antiquity in the literature of the Old Testament. It was the period of time deemed suitable for purposes of trial, punishment, preparation, or purification in matters either mundane or spiritual.

Dr. Clemow makes mention of one passage in Leviticus, but the Old Testament is teeming with references to the precise period of time under consideration. The world was purged of evildoers by the Great Flood in forty days (Genesis vii, 17); Moses was forty days in the mount at the giving of the law (Exodus xxiv, 18), presumably a period of preparation and communion with the Deity; and the Israelites spent forty days searching and making trial of the land of Canaan (Numbers xiii, 25). Other references with analogous applicability are found in I Samuel xvii, 16, in I Kings xix, 8, and in Jonah iii, 4.

The Israelites wandered forty years in the wilderness as a punishment—"to humble thee and to prove thee" (Deuteronomy viii, 2). The maximum number of stripes, or strokes, to be inflicted on a malefactor was also forty (Deuteronomy xxv, 3). The Messiah fasted in the wilderness forty days tempted of Satan, as a period of trial and preparation (Mark i, 13). [The neighbourhood is still known as Mount Quarantana or Jebel Kuruntul.]

In the early centuries of the Christian era, and especially in the mediaeval ages, there existed an intimate correlation between the Church and medicine. The priests and monks of the day were also the healers and quasi-practitioners of medicine. It would seem not unreasonable to suggest that in casting about for a suitable quarantine period they would adopt (or continue, rather) a custom sanctioned by Biblical usage, and therefore familiar to them, and one which, for that especial reason, would receive the imprimatur of the Church.—I am, etc.,

Boodepoort, Transvaal, March 12th. S. M. JACKSON, M.D.

Universities and Colleges.

UNIVERSITY OF CAMBRIDGE.

THE following candidates have been approved at the examination indicated:

DIPLOMA IN MEDICAL RADIOLOGY AND ELECTROLOGY.—*Part I:* W. S. Gross, A. Lazarow, R. Wear. *Part II:* N. H. Bharucha, S. J. Dikshit, D. MacD. Fraser, W. R. G. Frayne, J. B. Hartley, Helen M. Koeller, H. B. Padwick, N. A. Qureishi, A. M. Tripathi, R. Wear, C. Wroth.

UNIVERSITY OF GLASGOW.

AT the graduation ceremony on April 20th the following degrees were conferred:

M.D.—*A. Main, *A. S. Strachan, †O. H. M[illegible], †A. [illegible], G. M. Currie, R. J. L. Fraser, Margare[illegible].

M.B., Ch.B.—‡A. McN. Wylie, ‡A. T. [illegible], ‡T. D. Anderson, †T. F. Rodger, Ina E. Ashby, P. Barr, Jean M. Barrowman, R. S. P. Begg, R. P. Boyd, W. P. Brown, A. MacL. Campbell, I. S. Campbell, D. T. Clark, W. A. Clark, J. S. Craig, T. Dunlop, J. Fahy, R. Forrest, Isobel C. Fraser, P. A. Gallen, W. S. Gardner, Annie R. Greig, T. McF. Haughie, D. L. Henderson, H. W. Laing, J. W. Laird, L. W. Laurenson, H. R. Leishman, D. C. Liddle, J. H. McIlroona, D. R. McCalman, W. D. C. McCrorie, J. McMichael, W. J. McNeich, Georgina A. McNicol, A. F. Maguire, J. L. Mayer, T. R. Murray, A. J. Nairn, Mary S. Nicholson, J. P. O'Hear, Jean B. Parker, Ellen J. C. Ross (Mrs. Campbell), M. M. Scott, J. G. Stimson, W. Smith, J. Stewart, J. Taylor, H. R. Weir, H. Wyers.

* With high commendation. † With commendation.
‡ With honours.

The following prizes were presented to the successful candidates: The Captain H. S. Rankin, V.C., Memorial Prize of £4 10s., awarded to the student who obtained the highest marks in the subject of pathology in the professional examinations held in the year 1928, to W. S. Mack; the Bellahouston Gold Medal for eminent merit in thesis for M.D. to R. P. Smith; the Straits Settlements Gold Medal for thesis for M.D. on a subject in connexion with tropical medicine or tropical hygiene to John W. Graham; the Macewen Medal in surgery to J. S. M. Robertson; the Macleod Gold Medal for surgery to Jean G. P. Stephen.

CONJOINT BOARD IN SCOTLAND.

THE following candidates have been approved at the examinations indicated:

FINAL EXAMINATION.—*Medicine:* J. McK. Reid, A. K. Nandi, J. R. S. Gupta, L. Grunis, N. M. Valloly, A. R. Perera, D. Gould, L. A. Paranavitane, B. Kounine, J. Elliott. *Surgery:* F. J. Fell, R. W. Mungul, I. El-Aroussi. *Midwifery:* A. K. Nandi, N. M. Valloly, R. W. Mungul, A. R. Perera, A. S. K. Swami, H. Michaelson, L. St C. Ferguson, D. Gould, L. A. Paranavitane, B. Kounine. *Medical Jurisprudence and Public Health:* T. G. Ward, H. C. Fraser, M. A. Perera, W. C. Ross, D. D. W. Waidyasekera, A. J. Sutherland, A. O. Jollie, C. Cairncross, R. M. Irving, J. C. Coetzee, W. E. Faulkner, S. C. Grant, J. E. Le Fresnais, J. B. D. Oliver.

Out of 76 candidates entered the following, having passed the Final Examination, were admitted L.R.C.P.Ed., L.R.C.S.Ed., L.R.F.P.and S.Glas.:

M. E. Tiruchelvam, M. U. Hayat, Mary E. J. Magee, D. C. Dewar, K. R. L. Evans, S. Schmulian, Violet D. Hunter, J. C. Baumann, M. A. Yousef, Claire N. Frowusberger, S. S. Nagi, S. K. Mitra, Anna N. Edward, C. H. Lovell S. H. Al-Junied, I. Campbell, M. Rifaat, Anna G. McGregor, B. C. Guha.

The Services.

INDIAN MEDICAL SERVICE DINNER.

THE annual dinner of the Indian Medical Service will be held at the Trocadero Restaurant on Wednesday, June 19th, at 7.15 p.m. Lieut.-Colonel D. G. Crawford, "the historian of the service," has been invited to take the chair. Tickets, and all particulars, may be obtained from the joint honorary secretary, Major Sir Thomas Carey Evans, *M.C.*, 31, Wimpole Street.

DEATH IN THE SERVICES.

Lieut.-Colonel William Henry Steele, *R.A.M.C. (ret.)*, died at Clifton on March 25th, aged 84. He was born in Dublin on April 4th, 1844, and was educated at Trinity College, Dublin, where he graduated as A.B. and M.B. in 1866, and as M.D. in 1871. He had previously taken the L.R.C.S.I. in 1865, and became F.R.C.S.I. in 1889. He entered the army as assistant surgeon on October 2nd, 1866, attained the rank of brigade surgeon lieutenant-colonel on October 31st, 1892, and retired on March 3rd, 1897. When on the retired list he was employed at Devonport, in 1897-98, at Horfield, Bristol, in 1898-1905, and at Hot Wells, Bristol, in 1905-9. During his old regimental days he served in the Royal Artillery. He served in the Abyssinian war of 1867-68, and in the Ashanti war of 1873-74, receiving the medal granted for each of these campaigns.

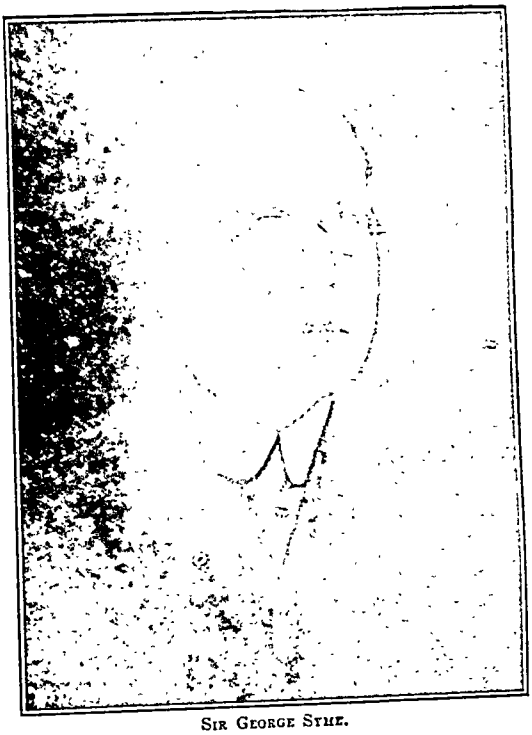
Obituary.

SIR GEORGE ADLINGTON SYME, K.B.E., LL.D., M.S., F.R.C.S., Hon. F.A.C.S.,

First President of the College of Surgeons of Australasia, Vice-President of the British Medical Association.

WE have to record with deep regret the death of Sir George Syme, K.B.E., after a life of distinguished service to surgery and to the British Medical Association in Australia.

George Adlington Syme was born in Nottingham in 1859, and was educated in Melbourne at Wesley College and the University, where he graduated M.B. in 1881 with first-class honours and a scholarship; he proceeded M.S. in 1883. After holding the appointment of resident medical officer at Melbourne Hospital from 1882 to 1883, he returned to England and became a member of King's College Hospital, where he worked under Lister; he obtained the diploma M.R.C.S. in 1884, and the F.R.C.S. in 1885. He then widened his experience by acting as clinical assistant at the Royal London Ophthalmic Hospital, the Central London Throat and Ear Hospital, and the Soho Hospital, after which he returned to Victoria in 1887 and was appointed demonstrator and examiner in anatomy in the University of Melbourne. He was also for a time pathologist to the Women's Hospital and editor of the *Australian Medical Journal*; he held the post of honorary surgeon to out-patients at the Melbourne Hospital from 1887 to 1903, and surgeon to in-patients from then till 1919. During 1888-89 he was secretary to the Royal Commission on the Sanitary Condition of Melbourne. He had been surgeon to the Police Force and to the Queen Victoria Hospital since 1889, consulting surgeon to the Melbourne Dental Hospital since 1891, honorary surgeon to St. Vincent's Hospital since 1893, and lecturer on anatomy and a member of the Faculty of Medicine in the University of Melbourne from 1900 to 1904. Since 1912 he had been a member of the University Council, and had served on various committees. He was a University representative on the Advisory Board of the Melbourne Hospital, and from time to time acted as an examiner for medical degrees in the University of Sydney.



SIR GEORGE SYME.

The value of the services rendered by Sir George Syme to the British Medical Association cannot be overestimated. He was three times president of the Victorian Branch, and served as secretary, treasurer, and president of the Sections of State Medicine, Medical Ethics, and of Surgery. In 1922 he was appointed chairman of the Federal Committee, and he has been reappointed every year subsequently. In 1923 he was president of the Australasian Medical Congress (British Medical Association) when the first session was held in Melbourne; in the same year he was elected a Vice-President of the Association. He was for many years the admitted leader of the medical profession in Australia, and, after his retirement from active practice in June, 1924, the Victorian Branch recognized his many services to the Association and the medical profession by presenting him with his portrait painted in oils by Sir John Longstaff; reference was made to this event in our columns on January 17th, 1925 (p. 134). The Branch further established in 1925 a Syme Foundation under the name of "George Adlington Syme Prize." In June, 1924, he received the honour of knighthood, and in the following year he was chairman of the Federal Royal Commission on Health. The formation of the College of Surgeons of Australasia was greatly helped by his co-operation, and in 1927 he was elected the first president. Among his other public appointments may be mentioned the following as indicating the width of his outlook: he was a member of the Appeal Board of the Commonwealth Repatriation Department, president of the Repertory Theatre, Victoria; trustee of the Medical Society of Victoria; and member of the committee of the new Presbyterian Church of Australia. He was the author of numerous contributions to medical literature, and published various lectures and addresses.

During the war he held the rank of lieutenant-colonel A.I.F., and was chief of the surgical staff of the First Australian General Hospital; he was also consulting surgeon to H.M. Hospital Ship *Gascon*.

It will be within the memory of our readers that he achieved a long-cherished desire when he came to England last year in connexion with the Annual Meeting of the British Medical Association in Cardiff. Together with two prominent South African members of the Association he was the guest of honour at a luncheon given by the Officers of the Association on July 6th, 1928. The degree of Doctor of Laws of the University of Wales *honoris causa* was conferred upon him, and Professor A. W. Sheen, who introduced him, spoke of the high appreciation felt by the University for the professional public work of one who was welcomed as a worthy representative of the medical profession of the Dominions and of the British Medical Association. He made an impression on those with whom he came into close contact in this country which explained the high estimation in which he was held in Australia and the confidence which was reposed in his judgement.

[The photograph reproduced is by Johnstone, O'Shannessy, and Falk, Melbourne.]

THE LATE DR. ALEXANDER GRANVILLE.

DR. ALEXANDER GRANVILLE, who died in London on March 23rd after a long and trying illness, was one of the most distinguished British officials who have served the Egyptian Government, and fully upheld the high standard of efficiency and conduct which characterized the administration of Cromer and Kitchener. A brief notice of his life and career has already appeared in our issue of March 30th (p. 623), but these further notes, contributed by a colleague, will be appreciated by the numerous members of the profession who came in contact with him during his life, and especially in Egypt during the period of the war.

At the beginning of this century, during the South African war, he contracted a bad attack of enteric fever, complicated by phlebitis; the resulting thrombosis adversely affected his health for the remainder of his life, and was finally responsible for his death at the age of 55 from embolism. As is frequently the case, he put on weight after his attack of enteric, and the burden of the flesh lay heavily upon him in his later years; although he made light of it, it handicapped severely a natural activity of the body, which was as much a part of him as his very active mind. His fine work in fighting plague in Upper Egypt in 1907-8 first directed attention to his great administrative abilities, and led to his appointment as M.O.H.

Cairo in 1908. He found full employment for his great talents in coping with the sanitary problems of one of the twenty largest cities of the world, with a death rate unknown in Europe, and a mixed population drawn from most of the races of the East and the West. In this he was so successful that in 1912, by Lord Kitchener's express wish, he was appointed director-general of the Alexandria municipality. The complicated affairs of this city had necessitated an inquiry, and a firm and steady hand and general reforming influence were needed, and were forthcoming in the person of Granville. This was one of his greatest successes; all his knowledge of men, tact, and powers of conciliation, and profound grasp of languages were needed to reconcile the differences and reform the abuses which had sprung up in the management of the affairs of this great cosmopolitan city, with all the undercurrents of Levantine and Oriental subtlety. On the death of Sir Armand Ruffer in 1917 he succeeded him as president of the International Quarantine Board, giving up his position as director-general, but retaining his connexion with Alexandria as vice-president of the Municipal Commission. He also took over Sir Armand Ruffer's position as commissioner of the British Red Cross in Egypt, Palestine, and Syria. This was a very large and important administration, which did an enormous amount of work for the comfort of the sick and wounded, and which collaborated in a most friendly and willing fashion with the official Army Medical Service. After the war he became president of the Labour Conciliation Commission on labour troubles in Egypt, and for his services the dignity of Pasha was conferred upon him by King Fuad in 1922. He was also appointed president of the Egyptian medical delegation to the League of Nations. On retirement from the Egyptian Government Service in 1923 his services were retained to attend the meetings of the Office International d'Hygiène Publique in Paris as representative for Egypt. It was on one of the journeys from Paris to Geneva that he was stricken with illness so severe as to necessitate his gradual retirement from active work.

This brief sketch of his career gives some idea of the varied accomplishments of Dr. Granville, and of the force and power that he was among his fellow men, not only British, but also among all the nationalities which comprise the mixed population of the people of Egypt. His intimate colloquial knowledge of languages enabled him to penetrate the minds of the people of various nationalities with whom he had to deal—French, Italian, Greek, or Arab—in a way that is given to few Britishers. In addition, his sympathetic interest and his remarkable capacity for friendship gave him an influence over individuals of all classes, from the highest to the lowest, of a most exceptional kind, and caused him to be regarded with a very sincere affection by all with whom he came in contact.

Apart from the onerous duties of his official career, his private life was a very full one. Until he fell into very poor health he thoroughly enjoyed every moment of his life, and even towards the end his unquenchable spirit seldom failed to see the silver lining to the cloud. For instance, on partial recovery from a slight stroke which affected his speech some months before his death, he smilingly remarked that it was the first time in his life that he had ever stopped talking. He was a fluent and ready speaker and a brilliant raconteur, gifted with a very retentive memory. He had a critical appreciation of art in all its forms. His private letters were full of wit and humour, and were generally illustrated with delightful little sketches of people and places and events in line or colour, dashed off on the spur of the moment by his facile hand. Indeed, these gifts were such that had his career tended in that direction he could have become an artist of renown. Literature and music were no less attractive to him, and wood-carving, self-taught, from his own designs was one of the hobbies of his later years.

There is no doubt that Granville Pasha's was one of the ablest and cleverest brains in Egypt during his time, and he had the will and the energy to employ it to the greatest advantage, whether at work or play. He was most versatile, and interested in everything around him; he enjoyed good food and wine and pleasant company, was the life of any party or gathering, whether grave or gay, and was the very soul of hospitality in his own house and elsewhere. His friends, who were legion, feel that they will never look upon his like again. He was buried in Chiswick cemetery, and his funeral was attended by a large number of his Egyptian friends and associates, including the Egyptian Chargé d'Affaires.

THE LATE SIR BERTRAM WINDLE.

DR. R. ALLAN BENNETT (Talcahuano, Chile) writes: The announcement on February 23rd (p. 375) of Sir Bertram Windle's death will carry many an old Birmingham man back in spirit to the prehistoric dissecting rooms of the Queen's College, and to the dark and dangerous stone stairs that deviously led to them. Now, nearly forty years after, I can see Dr. Windle's tall figure dash into the lecture room; I feel again the hush that used to fall upon the most turbulent as his grey apocalyptic eye ranged over the class; and I can remember, as though it were but yesterday, the patience, the brilliance, the vividness of his enthralling lectures. He never appeared to bother much about our personalities. He rarely spoke to us, and hardly ever had a word of encouragement or of praise; but in after years one awoke to the fact that he had always taken the keenest interest in the performances of his men, and the realization dawned that behind that singularly undemonstrative manner lay innumerable springs of kindness and of loyalty. He was just, and fierce, and self-sufficient, and he was the greatest teacher I ever knew.

DR. ARTHUR MURRAY MASTERS, who died on March 9th at the age of 48, was born in New South Wales, received his medical education at Edinburgh, and graduated M.B., Ch.B. in 1910; four years later he proceeded M.D. After holding the appointments of assistant resident medical officer to the Westmorland Sanatorium and assistant tuberculosis officer at the Stepney Dispensary, he joined the county of Durham health service as a district tuberculosis officer in November, 1914. During the war he served as a captain in the R.A.M.C. from 1916 to 1919 in India, where he contracted the illness which caused his untimely death. He had exceptional experience of tuberculous disease, and his opinion as a consultant was much valued by medical practitioners in his district. His friends and colleagues on the Durham county medical staff respected him highly for his great sincerity and his integrity of character. Dr. Masters was a member of the British Medical Association, the Northern Branch of the Society of Medical Officers of Health, and the North of England Tuberculosis Society. He leaves a widow but no family.

DR. ROBERT SAMUEL TROTTER, who died in Sydney on March 10th, aged 59, was the eldest son of the late Dr. Robert Bruce Trotter of Perth, Scotland, and a brother of Dr. Alexander Trotter of Perth. He received his medical education at Aberdeen, Edinburgh, and Newcastle-on-Tyne, and graduated M.B., C.M.Aberd. in 1898, proceeding M.D. in 1903. In 1908 he obtained the B.Hy.Dunelm. and the D.P.H., and in 1911 the D.Hy. He was awarded the certificate of the Royal Medico-Psychological Association. He succeeded his uncle, Dr. James Trotter, in practice at Bedlington in 1899, and was medical officer of health there and a member of the Northumberland County Council until 1914, when he left to take up the appointment of medical officer, Fiji. In 1916 he became chief medical officer of Raratonga, capital of the Cook Islands. In 1925 he was appointed medical officer of health for Broken Hill, New South Wales, but after six months he resigned owing to ill health. Dr. Trotter was the author of some valuable contributions on miner's phthisis, and wrote the article on this subject in the *Encyclopaedia Medica*. He was for many years a member of the British Medical Association; in 1912 he was vice-chairman of the Blyth Division, and chairman from 1913 to 1915. He was a member of the North of England Branch Council from 1912 to 1915. Dr. Trotter married Miss Janetta Stevens Martin of Perth, who, with a son and daughter, survives him. He will be remembered by a large circle of friends in the North of Scotland and the North of England as well as in the Islands of the Pacific.

The following well-known foreign medical men have recently died: Geheimrat PAUL DOEHLE, formerly professor of pathology at Kiel University, aged 73; Dr. ALOIS KREIDL, professor of physiology in Vienna; and Geheimrat KORTE, the oldest medical practitioner in Germany, aged 93.

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

THE House of Commons this week considered the Budget resolutions and the Finance Bill, and also discussed education and unemployment. *Amendments made by the House of Lords in the Local Government (Scotland) Bill* were put down for review by the House of Commons on April 26th.

In the House of Lords, on April 23rd, Viscount GAGE, on behalf of Lord Desborough, introduced a bill to enable the Council of the Pharmaceutical Society of Great Britain to make by-laws providing for the registration without examination of persons desiring to be registered as pharmaceutical chemists in Northern Ireland. The bill was read a first time.

The Parliamentary Medical Committee met at the House of Commons on April 22nd, probably for the last time before the General Election. Votes of thanks were carried to the chairman, Dr. Fremantle, who has been in the chair for nearly five years, and to the honorary secretary, Dr. Drummond Shiels. The Committee discussed the recent small-pox outbreak, and hoped that the Government would impress on the general public the advisability of vaccination and the facilities available for it. Attention was drawn to the fact that the two international *health organizations*, in Paris and Geneva respectively, had not provided a sufficient channel for discussion before action was taken by the *French Government*. There was a discussion about the Government's *scheme* for the purchase of radium, and Lord DAWSON OF PENN made a full statement. The Committee passed a resolution welcoming the announcement that the door is still open for a conference with the medical profession, and it held emphatically that full use should be made of such invitations to consult before action was taken *under the Government's plan*. *Consideration* was given to the results of Lord Onslow's *appointment* as acting Under-Secretary of Health in the *Lords for the Local Government Bill*. The Committee resolved that it was desirable for the Government to make permanent the appointment of a second Parliamentary Under-Secretary to the Minister of Health, in view of the heavy work of that Minister in Parliament and of the calls on him for conferences and inspections. The Committee concurred in the suggestion that at the coming General Election all medical men who were candidates should press for the clearance of slums and continuance of a national housing effort; for reform of the Lunacy Laws; for the amendment of the Factories and Workshops Acts; and for the active and progressive administration of the new Local Government Act.

On April 24th Mr. Baldwin announced that Parliament would be dissolved on May 10th, and the General Election would follow on May 30th. Among the bills which he enumerated as likely to pass into law before the dissolution was the Pharmacy (Northern Ireland) Bill, but he did not include the Preservation of Infant Life Bill, which now awaits consideration by a committee of the House of Commons.

Local Government (Scotland) Bill.

In the House of Lords, on April 17th, Lord SALISBURY brought up the Local Government (Scotland) Bill on the report stage. In Clause 5, dealing with the transfer of the functions of the parish council, Lord ONSLOW moved to insert a new subsection, as follows:

(5) Where in the constitution of any trust or other body, whether corporate or not, provision is made for the appointment as trustees or members of the governing body of one or more members of a district board of control whose functions are by this Act transferred to two or more transferee authorities, the General Board of Control for Scotland may, after consultation with the trustees or governing body, by order provide for the transferee authorities concerned jointly or a joint committee thereof or for the transferee authorities severally nominating trustees or members of the governing body in place of the members of the district board of control, and the constitution of the trust or other body shall have effect subject to the provisions of any such order.

Lord Onslow said the amendment was designed to meet such a case as that of the Royal Asylum at Montrose, where under the constitution the District Board of Control had a right to appoint representatives to the governing body. That district board would now disappear, and its functions would be transferred to two separate authorities, the county council of Angus and of Kincardine. The amendment authorized the General Board of Control to provide that the appointment of these representatives should be made either by the two county councils jointly, or by a joint committee, or else a stated number of appointments might be given to one county council and a stated number to the other.

The amendment was accepted without debate.

A drafting amendment was made in Clause 14, subsection 5, which enacts that every administrative scheme relating to education made by the council of a county, which includes a large burgh, for the purposes of education, shall make provision for medical inspection, supervision, and treatment of children attending the borough schools, and that in this provision the county council shall utilize the medical and nursing staff of the town council and the clinics and hospitals under the control of that council. As amended the clause provides that "the county council before making any such scheme, and the department before approving any such scheme, shall consult with the town council, and any such scheme when so approved shall be binding on the town council." The amendment was accepted.

Clause 35 relates to the appointment of medical officers of health and sanitary inspectors. Lord Onslow moved a drafting amendment to ensure that the provisions of the clause applied to a vacancy which had not been filled at the commencement of the Act as well as to a vacancy arising after that date. The House accepted the amendment, and Lord YOUNGER then moved to leave out the whole clause in order to substitute a new form of words intended to ensure that county sanitary inspectors in Scotland should always become the sanitary inspectors of the small burghs. He contended that this would secure a much better official and a more independent man. Lord ONSLOW said the House had already accepted this principle of appointment of the county authority in the case of the medical officer of health, but different considerations presented themselves in respect of the sanitary inspector. In some of the smaller burghs of Scotland only a very small sum was available for the payment of a sanitary inspector. The bill sought to ensure that all sanitary inspectors should be thoroughly qualified persons. Under Lord Younger's amendment the county sanitary inspector would be concerned with major sanitary services in a small burgh, and the burgh sanitary inspector with lesser services, including the supervision of lodging houses. Many of the smaller Scottish burghs had represented strongly that it was desirable that they should have a sanitary inspector to themselves. Seaside resorts had pressed for this. Under the Government's clause the smaller burghs could secure their wish, provided their official was a qualified man as prescribed by the Department of Health. If a burgh wished to have a sanitary inspector, but could not afford to pay for a qualified man, then that burgh must come to an arrangement, and in all probability it would appoint the county sanitary inspector.

Lord SALISBURY said that if Lord Younger's amendment was carried the sanitary inspector would not be under the medical officer for all purposes. One of the unsatisfactory features of the law in Scotland was that even if the amendment were carried the sanitary inspector could not for all purposes be under the medical officer of health. The proper relation between the sanitary inspector and the medical officer was one of subordination, and in process of time legislation would probably provide that the sanitary inspector was so placed for all purposes. The House divided, and rejected by 33 to 20 the clause as it appeared in the bill. The clause in the new bill proposed by Lord Younger was then inserted in the bill as follows:

On a vacancy arising after the commencement of this Act in the office of medical officer of health or sanitary inspector of a small burgh, the medical officer of health or sanitary inspector, as the case may be, of the county within which the burgh is situated shall *ipso facto* become the medical officer of health or sanitary inspector for the burgh, and such proportion of the salaries and expenses of such officer as the county council and the town council may agree shall be paid by the town council to the county council, and, failing agreement, as may be determined by the Department of Health.

In the first schedule of the bill, which relates to the functions transferred to county councils from the town councils of small burghs, Lord ONSLOW moved to add the Explosives Acts 1875 to 1923, and the Petroleum Consolidation Act, 1928 except Section 11. He explained that this meant that the section of the Petroleum Act relating to questions of amenity would not be transferred.

The report stage was concluded and the bill put down for third reading on April 25th.

Small-pox.

In a reply to a question by Mr RAMSAY MACDONALD on April 17th, Sir AUSTEN CHAMBERLAIN said he understood that the French Council of Ministers had that day decided provisionally to suspend the order demanding from passengers landing in France from Great Britain, from India, and other places evidence that they had been vaccinated within the last two months. He further understood that the Council had decided to arrange for a meeting between the French and English health authorities, so that the two countries could act in common in taking whatever precautions might be deemed necessary. The British Foreign Office had pointed out to the French Government that the occurrence of small-pox in the United Kingdom was very restricted. The period of incubation of the disease from the ship *Tuscania* was over, and there were no reasons to anticipate any further cases. There was nothing in the nature of an epidemic.

On the same day Sir JOHN GILMOUR (Secretary for Scotland) said the steamer *Tuscania* had been dealt with by the medical authorities of the Port of Glasgow in the manner authorized by the

International Sanitary Convention of 1926, which had been ratified by the United Kingdom last year. Two engineers and some frozen poultry had been transferred from the *Tuscania* to the s.s. *Caledonia* before the former vessel had been fumigated or disinfected. The doctor and the purser of the *Caledonia* were notified that the engineers and foodstuffs were from the former ship. Under the International Sanitary Convention the medical officer of health for Glasgow had no power to prevent the transfer to another vessel of the engineers, who were not suffering from small-pox, or of the foodstuffs, even if he had thought it desirable to do so. Sir John Gilmour added that he was satisfied that the measures taken by the medical authorities of Glasgow were in accordance with the International Sanitary Convention, and were all that could reasonably be done to prevent the spread of infection. He promised to investigate an allegation by Mr. Johnston that flour had been transferred from the *Tuscania* to another ship, and that information on the subject had been given to the port medical authorities by the dockers who had to handle these goods.

Dr. VERNON DAVIES asked whether the medical officer of the *Caledonia* knew that these engineers and foodstuffs came from a vessel in which small-pox had broken out. Sir JOHN GILMOUR said he was told the medical officer was fully aware of the circumstances.

Answering Dr. Fremantle, on April 18th, Mr. CHAMBERLAIN said the number of cases of small-pox among the 1,598 persons (passengers and crew) of the s.s. *Tuscania* was 45, which is 10 more than the figure of 35 announced on April 13th. There had been seven deaths. The vaccination history of the patients who died, and of the other patients, was not yet available. All other patients notified had been isolated in hospital, and all the contacts kept under supervision. He had no information, at present that any persons other than those who were on board this ship had contracted small-pox from contact with the passengers or crew. The rigorous action which had been taken in the United Kingdom to prevent the spread of small-pox from this vessel appeared to have proved effectual. As the ship arrived seventeen days ago, any serious risk of a widespread outbreak of the disease should now be at an end, even though some secondary cases might arise. For the community in general facilities were always available for free vaccination, the best safeguard against any risk of infection. He hoped to secure the vaccination history of those who had died, and would convey the information to Dr. Fremantle.

Dr. FREMANTLE further asked, on April 18th, the number of small-pox cases amongst passengers and crew of the s.s. *Mashobra*, shortly due at Southampton from Bombay; what number of passengers landed at Marseilles for England; and what steps were being taken to prevent the introduction of small-pox through them into this country. Mr. CHAMBERLAIN said it was not yet known whether there had been any small-pox aboard the *Mashobra*, but all precautions were being taken, and she would be closely inspected at Plymouth, her first port of arrival. He was informed that 31 of her passengers landed at Marseilles. Whether a case of small-pox was landed there from this ship was not known.

Mr. GODFREY LOCKER-LAMPSON told Dr. Fremantle, on April 18th, that official confirmation had been received of the suspension of the new French regulations with regard to the revaccination of persons travelling from the United Kingdom to France. Discussions continued with the French Government. Dr. FREMANTLE asked why such action should have been taken when at least two international bodies dealt with health matters, one in Paris and one at Geneva. The SPEAKER suggested that this question should be put down.

Sir GEORGE HENNESSY, answering for the India Office on April 18th, told Mr. Viant that there was an epidemic of small-pox in Bombay City, where there had been 233 cases and 130 deaths between January 1st and February 16th. According to a press report the deaths from January 1st to March 18th numbered 368. In the whole of British India between January 1st and February 16th there were 19,529 cases of small-pox and 4,821 deaths, the case and mortality rates being approximately the same as for 1928.

Radium.

Commander KENWORTHY asked, on April 18th, whether the Government had proposals for international action through the League of Nations for control of the available supplies of radium and their price. Mr. CHAMBERLAIN said that until the organization had been established which the Government proposed should act as an agency for the purchase of radium in this country or for Dominion or Colonial Governments, and until experience had shown how far this organization met the needs, to consider international action would be premature. He hoped that the setting up of the organization would not take long. International action was not mentioned in the report of the subcommittee of the Committee of Civil Research, and the immediate question for the United Kingdom was whether it could obtain the supplies it required at a reasonable price. There was every reason to believe that could be done.

Dr. VERNON DAVIES asked whether the House before it rose would have a chance of discussing this report.

Mr. CHAMBERLAIN said he supposed there would be a supplementary estimate for the amount to be contributed by the Government. He thought that would give an opportunity for discussion. The subcommittee which presented the report had finished its labours.

Sir KINGSLEY WOOD informed Mr. R. Morrison that the functions of the trustees, as defined in paragraph 82 of the Radium Subcommittee's Report, would not extend to the expenditure of any funds in an endeavour to discover independent sources of supply. The Government could not give the date of the public appeal for funds to purchase radium, though they hoped it would be made in the near future. The precise form of the organization recommended by the Radium Subcommittee, and accepted in principle by the Government, was under discussion, and Sir Kingsley hoped it would be settled in a very short time. Mr. MORRISON asked whether the promised statement would be published before the General Election. Sir KINGSLEY WOOD replied that he hoped it would be published within a few days.

Report of the Joint Committee on Mental Deficiency.

Answering questions put on April 18th by Commander Kenworthy and Mr. R. Morrison, Mr. CHAMBERLAIN repeated his previous refusal to undertake to publish, until he had given full consideration to it, any part of the report of the Joint Committee on Mental Deficiency other than that which related to children. He had not yet had an opportunity of looking at the report.

Mr. PETHICK-LAWRENCE asked whether local authorities had to put part of the report into force and to prepare schemes before September.

Mr. CHAMBERLAIN said there was a good deal of time before September. He could not say definitely when the report would be published. Actually there were two reports. That relating to children was for the Board of Education to consider. That relating to adults raised a bigger question. He was not sure what effect the report would have on the liberty of the subject.

Dr. VERNON DAVIES asked whether Mr. Chamberlain would carefully study the report before arriving at decisions on the schemes submitted by local authorities. Mr. CHAMBERLAIN: Certainly.

National Insurance.—During a discussion on the Dominions Office Vote in the House of Commons on April 18th, Mr. J. H. THOMAS suggested that nationally insured persons leaving the United Kingdom for the Dominions should be permitted to commute the reserve value of the payments they had made. Mr. AMERY replied that a committee under Sir Donald Maclean had come to the conclusion that, except in case of deposit contributors to national health insurance there was no fund from which the insured person could claim a surrender value, and the payment of any sum on emigration would fall on the Exchequer. He would like, however, to see the whole problem reinvestigated.

Dental Treatment under the Insurance Acts.—On April 22nd Mr. CHAMBERLAIN, replying to Mr. Shinwell, who asked if he was aware that applicants for dental treatment who were members of approved societies in the London area were being inconvenienced through delays in dealing with their claims, said that, owing to a large and rapid increase in the number of cases referred to the regional dental staff, there had been some delays of the kind suggested. Steps had been taken, and a considerable improvement had been effected.

War Pensions: Final Awards.—On April 16th Lieut.-Colonel G. F. STANLEY told Lieutenant Commander Kenworthy that the statutory regulations of the Ministry of Pensions required that a final award (in cases of recurrent disability, including neurasthenia, gas poisoning, and malaria) should not be made until the condition was reasonably stable. He was not aware that hardship had been caused in any class of case by the granting of final awards, whether of life pension or other form of compensation. Each case was considered on its merits, and, in any event, the man had a right to appeal to an independent tribunal. If a condition due to war service called for treatment, it could be provided, and allowances could also be paid where they were justified, notwithstanding that a final award might have been made. If, as a result of such treatment, the final award was found to have been seriously erroneous as an assessment for permanent purposes, a further grant of pension could be made under special sanction.

Doctors on County or Borough Councils.—On April 19th Sir CHARLES TREVELYAN asked whether, when the powers of the boards of guardians were transferred to a city or county council, a councillor who was holding a position such as doctor or public vaccinator under the transferred board would be compelled to resign his position as councillor if he continued his professional work under the new authority. Mr. CHAMBERLAIN said he was advised that a person who, after April 1st, 1930, held such a position as that of district medical officer or public vaccinator under a county or county borough council would be disqualified from being a member of that council.

Homes Registered under the Nursing Homes Act.—Sir KINGSLEY WOOD told Sir Robert Thomas, on April 17th, that medical officers of health had been asked to include in their annual reports for 1928 statistics of homes registered under the Nursing Homes Act, which came into operation on July 1st, 1928. These reports were not yet available, and the Minister of Health had no detail information of how local supervising authorities were exercising their powers to insert nursing homes under the Act.

Notes in Brief.

Three education authorities in Wales—Cardiganshire, Carmarthen Borough, and Pembroke Borough—at present make no provision for dental treatment of school children.

A Slaughter of Animals Bill, presented by Colonel Moore and supported by Dr. Drummond Shiels, was read a first time in the House of Commons on April 18th.

The proposal of the German Government to ratify the Geneva protocol prohibiting the use of poison gas in war was passed by the Reichstag on March 21st, but the British Foreign Office was not aware on April 18th that Germany had yet formally ratified it.

According to the Registrar-General's statistical review the estimated populations of the United Kingdom for the years 1924–27 inclusive were 44,826,000, 45,040,000, 45,218,000 and 45,435,000 respectively, an average annual increase during that period of 183,000.

The chief alkali inspector of the Ministry of Health has made a report on the emission of fumes from artificial silk works. The Minister of Health is arranging for the publication of the report.

Medical News.

THE Prince of Wales will lay the foundation stone of the Eastman Dental Clinic (adjoining the Royal Free Hospital in Gray's Inn Road) on Tuesday, April 30th, at 2.30 p.m.

THE fifteenth annual conference of the National Association for the Prevention of Tuberculosis will be held on October 10th, 11th, and 12th at Newcastle-upon-Tyne. Further particulars will be issued shortly from the association's office, 1, Gordon Square, W.C.1. The association is at present conducting a series of popular educational lectures on the prevention of tuberculosis in the following parts of the country: North Uist, Oxfordshire, and Shropshire.

A SERIES of lectures and counter-lectures in aid of King Edward's Hospital Fund for London will be given at the London School of Economics, Houghton Street, Aldwych, at 5.30 p.m. on Tuesdays, April 30th, May 7th, 14th, and 28th, and June 4th. Further information and tickets may be obtained from the Secretary of the Fund, 7, Walbrook, E.C.4.

AT a meeting of the Illuminating Engineering Society (32, Victoria Street, S.W.) on Tuesday, April 30th, at 7 p.m., Mr. S. English, D.Sc., will open a discussion on some further properties of glass and their application in illuminating engineering.

THE annual general meeting of the London and Counties Medical Protection Society will be held at Victory House, Leicester Square, W.C.2, on Wednesday, May 1st, at 4 p.m., to receive the annual report and balance sheet, to elect officers, and to transact other business.

THE special M.R.C.P. course arranged by the Fellowship of Medicine from May 7th to June 24th will consist of sixteen lectures, on Tuesdays and Fridays, at the lecture hall of the Medical Society of London, 11, Chandos Street, W.1. An intensive course in diseases of the throat, nose, and ear will be held at the Central London Throat, Nose, and Ear Hospital from April 29th to May 18th. A special course in psychological medicine, with lectures and demonstrations, will continue at the Maudsley Hospital from April 29th to May 31st. The Fellowship of Medicine has arranged a summer programme of clinical lecture-demonstrations in medicine and surgery. On April 30th, at 2 p.m., Dr. H. V. Morlock will deliver a lecture on "Early infiltration and its relation to the development of phthisis"; on the same date, at 2.15 p.m., Mr. George Waugh will give a ward demonstration at the Hampstead General Hospital. Both of these are free to the medical profession. For those interested in neurology two weeks still remain of the late afternoon course daily at the West End Hospital for Nervous Diseases. From May 2nd to June 1st the London School of Dermatology (St. John's Hospital) will hold a special course consisting of clinical instruction in the out-patients' department, and lectures on specific dates. Pathological demonstrations can also be arranged. A four weeks' course in venereal diseases will be available at the London Lock Hospital, Dean Street, W.1, from May 6th to June 1st. On May 17th Professor Louise McIlroy will begin a series of four demonstrations on ante-natal diagnosis and treatment, limited to ten post-graduates. The last of the lecture-demonstrations at the Royal Free Hospital will take place on May 1st, and will deal with electro-therapeutic methods and apparatus in use in the department. Detailed syllabuses of any of the foregoing courses may be obtained from the Secretary of the Fellowship, 1, Wimpole Street, W.1, who will also supply information relating to the general course work at the various London general and special hospitals and copies of the *Post-Graduate Medical Journal*.

THE thirty-third post-graduate course organized by the Vienna Medical Faculty on surgery, orthopaedics, urology, obstetrics, and gynaecology will be held from June 3rd to 15th. Further information can be obtained from the secretary, Dr. A. Kronfeld, Porzellangasse1, Wien IX.

THE Joint Tuberculosis Council announces that from May 10th to 18th a post-graduate course will be held in Paris at the Clinique de la Tuberculose, Hôpital Laennec, 42, Rue de Sèvres. The course will include lectures and visits to those antituberculosis institutions in Paris and in provincial centres which are of greatest interest and at the same time representative of French organization. The majority of the lectures, the subjects of which include heredity and tuberculosis, the clinical value of allergic reactions, the use of lipiodol in differential diagnosis, prophylaxis in early infancy, B.C.G. vaccine, treatment by sanocrysin, and French antituberculosis organization and legislation, will be delivered in English; the rest will be translated immediately. Further particulars may be obtained from the honorary secretary, Dr. William Brand, the Larches, Farnham Royal, Bucks.

THE ninth congress known as the Journées Médicales de Bruxelles will be held from June 22nd to the 26th, in association with meetings of other Belgian scientific societies, including the League against Rheumatism, the General Association of Dentists, the Society of Ophthalmology, and the Society of Preventive Eugenic Medicine. As usual, a large exhibition is being arranged, and there will be numerous social functions and excursions, including a visit to the new Medical Faculty at Brussels. Further information may be obtained from the general secretary, Dr. R. Beckers, 62, Rue Froissart, Brussels.

THE third international congress for sexual reform will be held in London, under the presidency of Havelock Ellis, August Forel, and Magnus Hirschfeld, from September 8th to 12th, when the following will be the principal subjects for discussion: marriage and divorce, campaign against prostitution and venereal diseases, birth control, and sexual ethnology. Further information can be obtained from Dr. Norman Haire, 127, Harley Street, W., or from the Institut für Sexualwissenschaften, In den Zelten 9, Berlin, N.W.40.

THE next French congress of orthopaedics will be held in Paris on October 11th, when the following subjects will be discussed: para-articular tuberculous lesions of bone, introduced by M. Andrieu of Berck-Plage, and recurrent dislocation of the shoulder, introduced by M. Louis Tavernier of Lyons.

THE following German congresses will be held in May: Society of Oto-rhino-laryngologists at Königsberg, 16th to 18th; Physiological Society at Kiel, 21st to 24th; Tuberculosis Society at Bad Pyrmont, 23rd to 26th; Society for Psychiatry at Dantzig, 23rd to 25th.

THE April issue of the *Archives Médicales Belges* contains a detailed programme, in both English and French, of the International Congress of Military Medicine and Pharmacy, which will be held in London, principally at the British Medical Association House, from May 6th to 11th. Short accounts are given also of the development of the Royal Naval Medical Service and the Royal Army Medical Corps. In this issue of the *Archives* there is also an article by Commander W. S. Bainbridge, of the United States Naval Medical Service, on the place of surgery in the treatment of malignant growths.

IN the annual report of the committee of University College, London, for the year ending February, 1929, it is mentioned that the department of pharmacology has been able to enlarge its scope and activity very advantageously as the result of its endowment by the Rockefeller Foundation. With the pending opening of the London School of Hygiene and Tropical Medicine the department of hygiene and public health at University College will cease to exist, but arrangements will be made for the instruction in hygiene which is required by students of municipal engineering and architecture.

THE Health and Cleanliness Council announces that it has a number of attractive pictorial health posters and instructive leaflets suitable for display. On January 25th (p. 183) we mentioned two pamphlets published by it respectively for girls and boys; a third, entitled *Hints for the Busy Housewife*, has now appeared and is likely to be as popular as its predecessors. Inquiries about supplies should be addressed to the secretary of the Council, 5, Tavistock Square, London, W.C.1.

LISTS of medical practitioners serving as members of local authorities or their subsidiary public bodies in Great Britain appeared in our issues of December 8th (p. 1057) and December 29th, 1928 (p. 1190), and February 16th (p. 314) and April 13th, 1929 (p. 702). We have since received intimation that Dr. Agnes Estcourt-Oswald was appointed a member of the Colchester Board of Guardians in April, 1923, that Dr. George MacFeat (Douglas) and Dr. G. E. Valentine (Uddingston) are members of the Lanarkshire County Council, that Dr. J. G. McCutcheon is a member of the Glasgow Town Council, and Dr. A. L. Pentland-Smith a member of the Elie Town Council, Fife. We are informed that Dr. E. E. Morrison of St. Andrews, whose name appeared in the list published in

our issue of April 13th as a member of the Fifeshire Education Authority, is not a member of the medical profession.

WE are informed that a Department of Dietetics was established at University College Hospital last November to deal with the special diets, particularly diabetes, nephritis, and gastro-intestinal disorders. The department is under the control of a member of the Honorary Medical Staff and in charge of Miss E. M. Marshall, B.Sc.Lond., who is a fully qualified dietitian. It is hoped later to inaugurate a school for the training of dietitians, with adequate courses of lectures combined with the practical work, for which fees will be charged. At present while such lectures are not available an opportunity occurs for the training of one or two pupils in practical dietetic work; this course would be of six months' duration and the instruction would be given free. Candidates should preferably possess a degree in Domestic Science. Further information can be obtained from the Matron of University College Hospital, Gower Street, W.C.

DR. T. STENNER EVANS of Dowlais, Glamorgan, has been appointed a Justice of the Peace for the County of Glamorgan.

A LOAN exhibition of old English silver (including Scottish and Irish) in aid of Queen Charlotte's Maternity Hospital will be held at Seaford House, Belgrave Square, S.W., from May 1st to 25th.

THE Académie de Médecine has awarded the Prince of Monaco prize of 100,000 francs to Professor Borel of Strasbourg for his work on the etiology of cancer.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W.C.1.***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1, on receipt of proofs.

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate Westcent, London.*
MEDICAL SECRETARY, *Mediocra Westcent, London.*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams: *Bacillus, Dublin*; telephone: 62550 Dublin), and of the Scottish Office, 7, Drumsheugh Gardens, Edinburgh (telegrams: *Associate, Edinburgh*; telephone 21361 Edinburgh).

QUERIES AND ANSWERS.

SCHMIDT'S SERUM.

DR. R. WHITTINGTON (Hove) writes: I should be grateful if anyone who has tried Drs. Otto and Wolfgang Schmidt's serum and who has found it of benefit in cancer would let me know their results, whether favourable or otherwise.

ANTIHIDROTIC.

"D. M." writes: Can any reader suggest treatment for excessive sweating of the axillae, very much more marked in the [illegible] persistently, irrespective of weather conditions? At one time the American preparation "odorono" controlled it for a few days, but it has no effect now. Inquirer has found that alcoholic solution, but always has very cold hands. The perspiration ceases towards evening, but is very distressing [illegible] the embarrassment of dressing after the morning bath (hot, followed by cold) and [illegible] clothes and causes a cold, clammy feeling, not to mention a certain amount of mental distress.

INCOME TAX.

Car Expenses of Assistant.

"J. M." is an assistant and pays his own car expenses, with the exception of petrol, oil, and garage. Can he claim anything in respect of that portion of the car expenses which is borne by himself?

*** We think that renewal of tyres, repairs, and, say, 15 or 20 per cent. for depreciation. The fact that one portion of the [illegible] is borne by the principal, and presumably deducted for [illegible] income tax return, does not in any way affect the liability of "J. M.'s" portion.

LETTERS, NOTES, ETC.

DR. HUGH DONOVAN writes: I am incorrectly reported in the *Birmingham Post* of April 20th as having stated at the annual meeting of the Birmingham Skin Hospital that I am treating patients with injections of gold. Actually I remarked, as a matter of popular interest, that an (unnamed) colleague of mine was doing this.

ARROWROOT.

SIR ALGERNON ASPINALL (secretary of the West India Committee) writes: From inquiries which I have made recently it would appear that chemists continue to sell at fancy prices "Bermuda arrowroot" in spite of the fact that arrowroot has not been produced in Bermuda for export for many years. In support of this statement I can produce documentary evidence, if required. The principal source of arrowroot to-day is the island of St. Vincent, British West Indies, whose product is derived from identically the same plant—namely, *Maranta arundinacea*—as that formerly cultivated in Bermuda. Another grievance of the St. Vincent proprietors is that arrowroot, which is quoted on the produce market at 3½d. to 11d. per pound, is offered for sale by chemists in the pulverized condition at such exorbitant prices as 3s. 8d. per pound, and even more in many cases. I hope that by my giving publicity to these grievances and to the fact that all the leading grocers are now selling pulverized St. Vincent arrowroot at 1s. to 1s. 4d. per pound, the chemists and druggists will adjust their prices to a more reasonable figure.

DIAGNOSTIC VALUE OF THE WASSERMANN TEST.

DR. M. F. MCELLIGOTT (Wrexham) writes: Are we absolutely justified in basing a diagnosis of syphilis on a report of a positive Wassermann reaction being present? Recently I had occasion to send a patient who had had several miscarriages to a gynaecologist, who, while considering that operative intervention might help the patient to reach full term in future pregnancies, decided, as is customary in patients with such a history, to perform a preliminary Wassermann test. The reaction was found to be positive, so we sent the patient to a venereal diseases clinic with the report. The medical officer in charge very properly took a blood sample, which, on investigation, gave a negative reaction. To be quite certain about the condition a second Wassermann test was performed a fortnight later, and again a negative finding was reported. I may say that, apart from the occurrence of frequent miscarriages, there was no history and no clinical evidence of syphilis; no antisyphilitic treatment had been given. At the present day we have a number of modifications of the original Wassermann test. Would it not avoid ambiguity if a strictly uniform method were employed in all laboratories? It is recognized that the heating of the patient's serum destroys a very large percentage of its total syphilitic antibody content. The necessity for heating can be obviated by using fresh serum, and it has been demonstrated that in some cases in which an inactivated serum gives a negative reaction an active serum from the same source may prove to be positive.

AN ANTIDOTE FOR MORPHINE POISONING.

DR. F. E. LOEWY (London, W.1) writes: It is of considerable practical importance, but not yet sufficiently appreciated, that we possess a powerful stimulant of the respiratory centre—the alkaloid lobeline, which is now available in sterilized ampoules, and can be used safely under proper precautions. It has proved very effective in poisoning by morphine, hyoscine, and other depressants of the respiratory centre, and should certainly be given in cases like those reported by Mr. A. E. Mortimer *Woolf* on March 16th (p. 499), when respiratory failure occurs after the administration of heroin. An ampoule of 1/20 grain should be injected intravenously very slowly, drop by drop. The effect is immediate but transient, and the injection may be repeated every ten to fifteen minutes. Intramuscular or subcutaneous injection of 3/20 grain is also useful, but less reliable. Lobeline should be at hand in every operating theatre.

THE DOCTOR AND CHEMICAL WARFARE.

"V. P." writes: Many of us will have read Dr. Arthur T. Jones's letter of April 6th with the greatest satisfaction. The idea of our profession as a whole taking a definite stand against warfare of any kind, and against chemical warfare in particular, should appeal to all and help to redeem science from the evil reputation which she earned in (what we hope will always be) "the *last* war."

THE USE OF THE TONSILS.

DR. W. S. WHITCOMBE (London, W.1) writes: Dr. McNamara's letter in your issue of April 6th (p. 670) on "The use of the tonsils" will, I hope, attract the attention it deserves. In my letter published in the *Lancet* (December 8th, 1928, p. 1209) I drew serious attention to this grave subject, and I feel sure that more regard should be paid to those who, after long years of clinical experience, consider generalized tonsillectomy unwise.

VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 44, 45, 46, 47, 50, and 51 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 48 and 49.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *175*.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

390. Clinical Significance of Cardiac Asthma.

R. S. PALMER and P. D. WHITE (*Journ. Amer. Med. Assoc.*, February 9th, 1929, p. 431) describe cardiac asthma as a paroxysmal acute dyspnœa which is usually nocturnal, but sometimes follows exertion. It may last for a few minutes or for hours, and is accompanied by a sense of suffocation, wheezing, and often by cough with frothy and blood-stained sputum. The more severe form has been termed acute suffocative pulmonary œdema. The authors, who report 250 cases, believe that cardiac asthma is due to left ventricular strain and failure, causing a stasis in the pulmonary circulation, the right ventricle supplying more blood than the left ventricle can deal with. This pulmonary circulatory stasis increases until by reflex stimulation the attack of asthma is induced and the patient awakes. On sitting up, the stasis and strain on the left ventricle are reduced and recovery follows. Morphine assists by reducing the irritability of the respiratory and other nerve centres. The authors' 250 cases of cardiac asthma occurred among 3,100 patients who had organic heart disease (8 per cent.). Of these patients, 180 were males and 70 females; only 14 were under the age of 40. The gravity of the condition is shown by the fact that 170 of these 250 patients are known to have died, with an average duration of life of 1.4 years after the first attack of cardiac asthma. There were 1,737 cases of the arterio-sclerotic hypertensive type; of these cases 187 (10.7 per cent.) had cardiac asthma; but the highest relative incidence occurred in syphilitic heart disease (21 per cent.) and in chronic nephritis (19 per cent.). Left ventricular failure due to one or more factors appears to be the exciting cause of cardiac asthma, but the mechanism is not clear. The frequency, duration, and severity of the attacks only affected the prognosis appreciably when they were extreme. Coincidence of feeble heart sounds, gallop rhythm, and pulsus alternans usually indicated early death. Aortic regurgitation (usually syphilitic) was the only common valve defect; it was found in 63 cases (25.2 per cent.). As regards treatment, digitalis and rest were generally successful in reducing the frequency of attacks, and appeared to prolong life. In acute spasms alcohol and the nitrites were sometimes useful, but morphine was the most effective remedy.

391. Haemorrhage in Haemophilia.

P. ÉMILE-WEIL (*Presse Méd.*, February 27th, 1929, p. 266) describes several types of haemorrhages in haemophilic patients and their appropriate treatment. A clean-cut wound is less dangerous than a contused one in that it can be sutured after careful haemostasis. The great point to remember is that the clot is slow-forming and imperfect; it is advisable to remove it and to place a pad soaked in serum directly on the bleeding points. Interstitial haemorrhages are generally less severe than the superficial owing to the pressure of surrounding tissues, but trouble is sometimes caused by the absorption of blood followed by haemorrhages elsewhere—haematuria and haemarthrosis. The gravity of some haemorrhages turns less on their endangering life than on their sequels. A joint in which a haemarthrosis occurs usually clears up the first time, but there is always a tendency for recurrence, and ankylosis may be the ultimate result. Prevention of haemorrhage is therefore of the utmost importance. Meningeal haemorrhage, though rare, must be recognized as a possibility; the withdrawal of pure blood by lumbar puncture should suggest such an occurrence, and suitable treatment be applied at once if the diagnosis is confirmed. Finally, the gravity of the haemorrhage may be due to its site, and the author describes cases of haematomata of the floor of the mouth in which deglutition and speech were quite impossible and death by suffocation seemed impending. Four cases of haematoma of the orbit came under the author's care. They were accompanied by loss of vision, exophthalmos, and corneal ulceration. Unfortunately only one of these cases was seen early in the haemorrhage, and transfusion of blood brought about recovery in a remarkable manner. The other three were seen late, and the total loss of vision became permanent. The author insists that haemophilic patients ought never to be allowed to die from haemorrhage, the arrest of which is an easy matter. Whenever possible, the wound should be minutely examined and cleaned; all blood and clots are removed, and a gauze dressing soaked in normal serum is applied. In internal haemorrhages blood transfusion is advisable; human or animal serum, citrated blood, or normal blood all seem equally effective. The author describes a preventive method which he has been using for over twenty-five years with excellent results. This consists of the monthly subcutaneous injection of 10 to 20 c.cm. of blood according to the age of the patients. In many of his cases spontaneous haemorrhages have entirely ceased and those produced by trauma have become much less severe. One patient, after seven years' treatment, now possesses perfectly normal blood. No serious anaphylactic accidents have been observed, but the best results are obtained by the use of human serum of one of the parents or other member of the family, preferably belonging to the same blood group.

392. "Illness of Infection" in Measles.

G. F. ABERCROMBIE (*Brit. Journ. Child. Dis.*, January–March, 1929, p. 15) describes personal cases of the illness of infection in measles, by which is meant a very rare condition in which a child exposed to the infection of measles a few hours earlier shows physical signs, such as slight rise of temperature, sneezing, conjunctival injection, and even a morbilliform rash, which all disappear in a day or two, but are followed within the incubation period by an undoubted attack of measles. According to Abercrombie an illness of infection in measles is much less rare than is usually supposed, but its signs and symptoms may be so trivial as commonly to escape observation. Goodall and Erdheim regard it as an attack of measles in miniature, whereas Orel holds that it is due to a mixed infection acquired simultaneously with the specific virus. Abercrombie suggests that on the occurrence of a case of measles in a community all the other members should be examined for signs of nasopharyngeal or respiratory catarrh; those who show any should be immediately isolated and injected with convalescent serum.

393. The Arneth Index in Diphtheria and Whooping-cough.

S. PAULON (*Giorn. med. d. Osp. Civ. di Venezia*, December, 1928, p. 238) examined the Arneth index in 24 cases of diphtheria and 19 of whooping-cough, as well as in cases of experimental diphtheria in the guinea-pig, and report the following conclusions. During the acute stage of diphtheria there is a well-marked shift to the left. In convalescence the index tends to move to the right, but it does not return to normal until some days after clinical recovery. Deviation to the left in diphtheria bears a direct relation to the severity of the intoxication, and in some cases the return is delayed. The examination of the Arneth scheme possesses prognostic importance in diphtheria, as progressive deviation of the nuclear index is an unfavourable sign. In the paroxysmal stage of whooping-cough there is a shift to the left; in the majority of cases this is most marked in the stage of decline, and is probably due to the frequency of tuberculous infection following pertussis.

Surgery.

394. One-stage Lobectomy.

H. BRUNN (*Arch. of Surg.*, Part II, January, 1929, p. 430) describes lobectomy as the ultimate goal in surgical procedures on the chest, since by this method the diseased lobe is removed at one stroke, the period of convalescence is diminished, and deformity does not result; he anticipates that lobectomy will become the operation of choice in many morbid pulmonary conditions. Six cases are reported, the operation having been performed for bronchiectasis in five, and for malignancy in one with removal of the lower and middle lobes; there was only one death. The lungs were seriously involved, without prospect of cure, but they were not hopelessly septic. Several months in bed with exposure to sunlight, postural drainage, the use of the bronchoscope, cleaning up of sinuses, and the possible use of vaccines was the preoperative treatment given, while in cases of spirochætal infections neoarsphenamine was used; 500 c.cm. of dextrose solution was given intravenously the night before the operation. During the lobectomy from 1,500 to 2,000 c.cm. of Ringer's solution was injected subcutaneously into the muscles of the thighs. For secondary shock, three to four hours after operation ephedrine, salt solution, and dextrose solution were given, and suction was employed to keep the chest free from fluid and air as far as possible; the suction was continued every two hours through the tube in the chest. After two or three days an *x*-ray picture is taken to see if the

upper and middle lobes have expanded. The factors making for success in one-stage lobectomy are said to be: the careful preparation of the patient; the use of local anaesthesia with scopolamine and morphine, preceded by barbital; careful haemostasis; and the prevention of pneumothorax and hydrothorax for at least five days after the operation.

395. Treatment of Traumatic Cerebro-spinal Meningitis.

I. CONSTANDACHE and M. FRANCKE (*Bull. et Mém. Soc. Méd. des Hop. de Bucarest*, December, 1928, p. 353) report a case of acute purulent cerebro-spinal meningitis, in which cure was obtained by spinal lavages and auto-vaccination. The patient, a man aged 60, had suffered a violent cranial injury, due to a fall, which was accompanied by cerebral disturbance, fracture of the anterior part of the base of the skull, serous discharge from the nose, and marked conjunctivo-palpebral ecchymoses. At the end of six weeks he had completely recovered, but a week later was suddenly seized with severe rigors, associated with headache, pains in the neck and back, vomiting, and hiccup. Opisthotonos, an accentuated stiffness of the occipital muscles, contraction of the lower limbs, Kernig's sign, and the contralateral reflex of Brudzinski were also present. Lumbar puncture revealed a whitish-yellow, sero-purulent fluid which showed an intense polynucleosis and an unidentified Gram-negative bacillus. As lumbar puncture, intraspinal injections of warm physiological serum, and subcutaneous injections of the purulent spinal fluid produced no effect, daily intraspinal lavage with physiological serum was instituted, the lavage being made through one needle inserted in the dorsal region and one in the lumbar. A week later this was supplemented by vaccination at daily intervals with the isolated organism; improvement ensued, and the lavages were performed less frequently, but, on a recrudescence occurring, the original treatment was again enforced. After two months the patient was completely cured, except for a slight defect in hearing. The authors believe that there was a direct association between the previous cranial injury and the meningitis, the infecting organism reaching the meninges from the nose through the fracture of the base. Attention is drawn to the persistence of treatment with drainage, intraspinal lavage, and auto-vaccination.

396. Prevention of Post-operative Pneumonia.

Y. HENDERSON and H. W. HAGGARD (*Journ. Amer. Med. Assoc.*, February 9th, 1929, p. 434) review the recent advances in the treatment of carbon monoxide asphyxia and post-asphyxial pneumonia by the inhalation of carbon dioxide and oxygen, and suggest that the procedure has an application in surgery. During partial or complete asphyxia or anaesthesia considerable areas of lung remain unventilated, the bronchioles become occluded by accumulating secretions, the alveolar air is gradually absorbed, and atelectasis or massive collapse follows. Infection of the bronchial walls results in the excessive production of sticky mucus. Occlusion of an air tube by this secretion shuts off the portion of lung to which it leads, whether a single lobe or an entire lung. When a pneumonic area has developed, irritation of the vagal endings induces shallow breathing; this leaves considerable areas unventilated, atelectasis develops, and infection of these unventilated and undrained areas may progress and cause pneumonia. The authors suggest that hyperventilation of the lungs by deep breathing due to the inhalation of carbon dioxide in proper dilution is a valuable preventive of post-operative pneumonia.

397. Otitis Media in Infants.

OTITIS media is thought by D. BOTTACIN (*Giornale Medico*, December, 1928, p. 290) to be frequently the cause of disturbances of nutrition in infants, possibly owing to the shortness of the Eustachian tube and the vulnerability of the tympanic mucous membrane, together with the vomiting and regurgitation which often occurs in the first few months of life. The number of nurslings who at necropsy show evidence of otitis media is, according to Feer, 70 per cent., and, according to Marfan, 90 per cent. Bottacin points out that pus may pass into the pharynx from the ear and, after being swallowed, cause diarrhoea and other intestinal disorders; the nutrition of the infant is consequently disturbed. Bottacin cites cases in which no physical signs were present during life, but at the necropsy pus was discovered in the middle ear. In other cases the only cause found for loss of weight, failure to take nourishment, and fever was a bulging of the tympanic membrane: paracentesis released the pus, after which the infant made a good recovery. The author considers the intestinal mucous membrane of a young infant to be the site of least resistance, and the effects of an otitis media therefore appear there; chronic otitis diminishes the general resistance and thus sets up a vicious circle.

Therapeutics.

398. The Use of Iodine in Hyperthyroidism.

A. S. JACKSON (*Amer. Journ. Surg.*, January, 1929, p. 7) gives his experience of the value of iodine in the treatment of 300 cases of exophthalmic goitre; he states that in every instance there was immediate and remarkable improvement. He has not found it so successful with other forms of hyperthyroidism, since in some cases the basal metabolic rate was increased, and the symptoms were intensified in toxic adenoma by giving iodine; he warns that iodine hyperthyroidism may be initiated in non-toxic adenomatous goitre by the indiscriminate use of iodine. Particularly good results were obtained with iodine used in conjunction with surgery for exophthalmic goitre, the average dose given being 60 drops a day of Lugol's solution for a week, the amount being doubled on the day of operation and the following day. Emesis and occasional distressing tracheitis have been overcome in toxic cases by the introduction of a duodenal tube on the evening preceding operation to permit the passage of large amounts of fluid, iodine, and nourishment. During the operation the patient receives glucose, orange juice, and iodine. Jackson contends that, provided there has been a proper period of preparation and his suggestions are followed, primary thyroidectomy may be safely performed in every case. The length of time during which iodine should be given in post-operative treatment depends on the amount of gland preserved and the rapidity of recovery. It should be discontinued if the metabolic rate has returned to normal within a month after operation. The author adds that the prolonged use of iodine in exophthalmic goitre may lead to cardiac decompensation and auricular fibrillation or hemiplegia, and in one case the systolic blood pressure increased to 268 after a year's treatment.

399. Excessive Thyroid Extract Dosage.

L. E. PARKINS (*New England Journ. Med.*, January 31st, 1929, p. 231) reports a case to illustrate the dangers in unusually high thyroid dosage. Large doses given over a prolonged period in the treatment of obesity are known to cause nervousness, tachycardia, dyspnoea, and acute pulmonary oedema. The author's patient had all these symptoms and weighed 206 lb.; she was only comfortable when sitting erect in a chair. Her history revealed the fact that four years previously she suffered from a chronic cough, and at that time her weight was 250 lb. Thyroid extract was given and the cough improved, but she continued to take the preparation as follows: 4½ grains daily for three months, 15 grains daily for six months, 7½ grains daily for 3 years and three months; this amounted to a total of 11,805 grains in four years, or an average of 8 grains a day. During the first year she lost 50 lb. in weight, but had been unable to reduce it further. The administration of thyroid extract was stopped, and a mixture containing the three bromides was given; for the acute pulmonary oedema morphine gr. ¼ was prescribed. With this treatment and rest the pulse dropped from 140 to 70 in ten days, but within a few months cardiac disease developed with decompensation and the patient died from cardiac failure. The author suggests that she probably never needed thyroid treatment, and points out how dangerous it is to use so potent a remedy as this extract without first determining the basal metabolism. If this is impracticable, then the pulse rate, blood pressure, and relation of food intake to work should be determined.

400. Intravenous Calcium Therapy.

S. RAMA IYER (*Indian Med. Gazette*, February, 1929, p. 77) records his experience of the use of a 7.5 per cent. calcium chloride solution for intravenous injection, especially in cases of gonorrhoeal orchitis. The chief symptom following the injection was a sense of heat all over the body, not lasting more than two minutes, and all the patients were able to walk about five minutes later, some even for distances ranging from half a mile to a mile and a half. The injections were followed in less than twenty-four hours by marked reduction in the pain and testicular swelling, particularly when the gonorrhoeal affection was recent. A similar result ensued in a case of gonorrhoeal epididymitis of long duration, though in others the sequels were not so striking. The urethral discharge remained unaffected. A stock solution was used; it was prepared by dissolving two drachms of calcium chloride in an ounce of distilled water; 2 c.cm. of this, boiled in a test-tube, was drawn into a sterile 10 c.cm. syringe, into which also freshly boiled normal saline solution was introduced up to 7 c.cm., and the solution thus diluted was injected intravenously. Of sixteen cases, notes of which are given, relief followed in all except three, in which no change was recorded.

401. Treatment of Carbon Monoxide Poisoning.

EXPERIMENTS *in vitro* and on animals as well as clinical observations have convinced F. KOZA (*Bratislavské Lekarské Listy*, January, 1929, p. 16) of the value of ultra-violet irradiation in the treatment of gas poisoning. It is claimed that the ultra-violet rays accelerate the dissociation of carboxyhaemoglobin to a very marked extent. Carboxyhaemoglobin poured into a Petri dish lost 20 per cent. of its initial content after five minutes' irradiation at a distance of 50 cm. The blood of a rabbit poisoned with coal-gas and showing 64 per cent. of carboxyhaemoglobin lost 50 per cent. of carbon monoxide after forty minutes' irradiation at 50 cm. distance, whereas the blood of a control rabbit, which was not irradiated, lost only 17 per cent. of the carbon monoxide during the same time. A similar very striking effect of the ultra-violet rays was observed in the case of two poisoned girls, one of whom was treated with ultra-violet rays, while the other was not. Apart from their direct dissociating influence, the ultra-violet rays are said to cause also changes of the acido-basic balance of the body, resulting in an immediate stimulation of the respiratory centre.

402. Malarial Treatment of General Paralysis.

A. MARIE and LAMBERT (*Bull. Soc. de Ther.*, January 9th, 1929, p. 9) record in tabular form their observations on fifteen cases of general paralysis treated by malaria as follows. A few cubic centimetres of blood are removed from the vein of a general paralytic during a malarial attack and inoculated into the patient's shoulder or vein. A reaction in the form of a typical attack of malarial fever occurs ten days later. Owing to certain premonitory or accidental rises of temperature before the malarial parasite becomes generalized in the system only a temperature of 100.4° and over is regarded as typical. The presence of the plasmodium in the blood is usually found in from forty-eight hours to three days after this temperature has been noted. In a few cases, however, the plasmodium appears in the absence of any rise of temperature, and it is in such cases that the most marked splenic reaction is observed. In one case, indeed, there was no rise of temperature or enlargement of the spleen, although the patient had a relative remission of his symptoms. Patients with symptoms of depression showed the least degree of febrile reaction. Under treatment by sodium stovarsolate intravenously, quinine hydrochloride 1 gram, and quinine sulphate 1 gram internally, the plasmodium disappeared in twenty-four hours, and did not return after provocative injections of adrenaline had been given.

Ophthalmology.

403. Complications of the Cataract Operation.

A. KNAPP (*Journ. Amer. Med. Assoc.*, December 8th, 1928, p. 1794) asserts that the most important complications after cataract operation are due primarily to the lens capsule; he describes the peculiarities that may be met with in the capsule and the methods of incising it. The opening and closing of the wound are of the greatest importance in determining the absorption of any retained cortex and the development of after-cataract. The varieties of after-cataract are: (1) cortical, in which the small capsulotomy wound closes promptly and the retained cortex remains in a closed bag; (2) capsular, caused by the thickening of the capsule or proliferation of capsular epithelium; and (3) iritic, in which a vascularized membrane lies on the thickened capsule adherent to the pupillary margin. Collius states that the frequency of after-cataract depends on the method of capsulotomy employed and on the cortical matter remaining at the operation. Glaucoma is the most important post-operative complication—the most dangerous to the eye and the most difficult to treat. Iritis with altered aqueous is a frequent though transient cause of this complication. Collins has shown that glaucoma develops from adhesion to or entanglement of the lens capsule in the extraction scar. Retained cortex causes glaucoma, particularly if it is shut off by adhesions, and operation is then necessary. The most important preventive is a properly placed corneal section; and next, correct technique of the capsule manœuvre. As a further complication following cataract operation E. C. ELLETT (ibid., p 1797) cites loss of vitreous, which may set up an iridocyclitis or a secondary glaucoma. Predisposing causes of vitreous prolapse are the general health of the patient, the blood pressure, and especially his nervous equilibrium and control. Among the immediate and exciting causes are the fluidity of the vitreous and pressure on the vitreous from within (from an intra-ocular haemorrhage or pressure on the ball). Ellett mentions the precautions necessary in operating, emphasizing especially the anaesthesia. Lost vitreous is not regenerated, but is apparently replaced by aqueous. This is the probable explanation of the fact that such small harm often follows a vitreous loss.

404. Irido-choroiditis in Cerebro-spinal Fever.

V. KNSTITCH (*Thèses de Lyon*, 1927–28, No. 276), who records eight illustrative cases in patients aged from 11 months to 28 years, states that cerebro spinal meningitis is fairly frequently complicated by irido-choroiditis, which in nine out of ten cases is unilateral. The metastatic ophthalmia due to cerebro-spinal meningitis assumes a special clinical form. Whereas the metastatic ophthalmia of medical origin, such as that occurring in pneumonia or influenza, or of surgical origin (suppurative arthritis or pyelonephritis), or of obstetrical origin (puerperal fever), usually assumes the character of a rapidly progressive suppurative panophthalmia which demands immediate enucleation, the metastatic ophthalmia of cerebro-spinal meningitis has a slow course. The irido-choroiditis is accompanied by little or no pain, and, though there is no corneal ulcer, hypopyon develops and may disappear spontaneously. In addition to this comparatively frequent form there is a plastic variety of irido-choroiditis, of which the author records two hitherto unpublished cases. The explanation of irido-choroiditis of this kind is a septic thrombosis or microbial embolism. The prognosis is grave, since unilateral or complete blindness may result, according as one or both eyes are affected. Specific treatment reduces the frequency of this complication, but appears to have little effect when once it has developed.

405. Choroidal Tumour.

P. PESME (*Gaz. Hebd. des Sci. Med. de Bordeaux*, December 9th, 1928, p. 788) describes two cases of choroidal tumour, both of which appeared macroscopically to be leucosarcomata. On microscopical examination the first was found to consist of long fusiform cells with large nuclei arranged in whorls; there was general agreement as to the sarcomatous nature of this tumour. In the second case the cells composing the tumour were of a distinctly epithelial character. In both instances there was infiltration of the normal choroidal tissues by tumour cells, and secondary pigmentation of the tumour by normal chromatophore cells of the choroid. Sections of the second tumour were submitted to Mawas of Paris, who confirmed the opinion as to the epithelial origin; he believes that such tumours are either melanotic epitheliomata arising directly from the choroid, or naevo-carcinomata derived indirectly through naevi. Redslob of Nantes, on the other hand, considered the tumour to be of nerve origin; Pesme considers this unlikely because of the obvious malignant nature. There is general agreement that the tumour belongs to a class of epithelial origin (ectodermal) and is not formed from conjunctival tissues.

Obstetrics and Gynaecology.

406. Epidural Anaesthesia in Obstetrics.

J.-R. HENRY and L. JAUR (*Gynécol. et Obstét.*, January, 1929, p. 19) state that the epidural space lying between the dura mater and the bone can be reached at various points, but especially in the sacral region, where it is more developed and where it surrounds the nerve roots forming the cauda equina. These nerves diverge in such a way that it is possible to regulate by the length of the needle employed for injection the penetrating depth of the anaesthetic—that is to say, the number of roots affected. Thus the lower alone, the lower and middle, or all the roots can be anaesthetized. Hence there are two varieties of epidural anaesthesia, the high and low. The former is obtained with a long needle entered to a depth of 4 or 5 cm.; in the latter a shorter needle, penetrating only 1 to 3 cm., is used. The anaesthetic employed by the authors is a mixture of the following solutions: sodium bicarbonate 0.15 gram, sodium chloride 0.1 gram, distilled water 20 c.cm.; and scurocaine 0.6 gram, adrenaline (1 in 1,000) 7 guttae, distilled water 10 c.cm. These are mixed at the time of using, and the average dose is from 15 to 20 c.cm. In the high method, anaesthesia appears in one or two minutes; in the low, it is slower and only commences five to twenty minutes after the injection. Low anaesthesia appears first in the perineal region between the anus and coccyx, and is then propagated from behind forwards and affects the perineum, vulva, and internal surface of the thighs. In high anaesthesia the effect extends further to the lower limbs and to the abdomen, as high as the umbilicus, sometimes even reaching the false ribs. The whole posterior portion of the patient is paralysed and insensible, and the uterus, bladder, and rectum are completely anaesthetized. The duration of the anaesthesia is

from one and a half to three hours, sensibility returning progressively in inverse order to the anaesthesia. The advantages of epidural over spinal or general anaesthesia are its decreased dangers, the absence of shock and general troubles, its long duration, and, especially in the low method, the absence of risk of uterine inertia. The disadvantages are: in the low type, the absence of anaesthesia of the corpus uteri; in the high, the very great danger of haemorrhages. High epidural anaesthesia should be limited to cases in which an interruption of labour for two or three hours is desired, to versions by difficult external manipulations, and to internal versions rendered painful by uterine contractions. The low method can be employed where an end of dilatation and a painless delivery are desirable; in cases of intervention, especially forceps application, and in perineorrhaphy, it constitutes the method of choice.

407. Remote Results of Wertheim's Operation.

VIOLET (*La Gynecol.*, December, 1928, p. 705) records the results of the treatment between 1909 and 1914 of 26 cases of carcinoma of the cervix; in 25 Wertheim's operation was employed, and one patient had vaginal hysterectomy. Four patients died. Of the 22 who survived the operation, 9 were free from recurrence six to ten years afterwards, and in a further "follow-up," made in the next decade, it was discovered that of these 9, 3 died. Violet contrasts these figures with the results in 32 cases of carcinoma cervicis treated in the same way from 1919 to 1928; 27 underwent Wertheim's operation, 3 had abdominal hysterectomy subsequent to radium, and in 2 vaginal hysterectomy was performed. Of the last, one had recurrence at the end of two years, but there had been no recurrence in the other at the end of six years. In the abdominal hysterectomy cases there was one operative death; one patient was without recurrence at the end of one year, and the third was living but had a recrudescence at the end of five years. Of the 27 Wertheim cases, 3 patients died after the operation, 8 showed a rapid recurrence, and, with regard to the remaining 16, the period of freedom from a recurrence varied from two and a half to nine years. Violet has treated an equal number of cases with radium, and whereas before 1923 he had had only one successful case, since then he has had four. From 1923 onwards, however, he has combined radium with deep *x*-ray therapy. The period of freedom from recurrence in the four cases mentioned ranged from three to five years. The author believes that the best indications of operability are non-involvement of the parametric tissue and a free mobility of the uterus. He urges that inflammatory change as a cause of uterine fixation must not be forgotten. For forty-eight hours before operation he uses vaginal dressings of H_2O_2, and just before operation he applies ether to the vagina and cervix. The recto-vaginal and vesico-vaginal tissues are left free to drain into the vagina, but the parametric tissue is shut off unless there is oozing. In spite of his good operative results, he has a great respect for treatment by radium combined with deep *x*-ray therapy.

Pathology.

408. A Comparison of the Wassermann and the Kahn Tests.

L. FIGUEIRA and C. TRINCAO (*C. R. Soc. de Biologie*, February 15th, 1929, p. 425) have made a comparison of the diagnostic value of the Wassermann and the Kahn tests in the diagnosis of syphilis. In performing the Wassermann test they allowed four hours in the ice-chest for the fixation of complement, since they consider that this increases the delicacy of the reaction. In the Kahn test they used three tubes: the dose of serum was constant—namely, 0.15 c.cm.; the dose of antigen varied as follows: 0.05, 0.0025, and 0.00125 c.cm. Altogether 1,076 serums were examined. In 948 serums the results of the two reactions were concordant; in 128 serums they were in disagreement. Of these 128 serums, 40 showed merely a difference in the degree of positivity; the remainder gave frankly contradictory results. Of these latter, 9 gave a positive Wassermann and a negative Kahn, while 79 gave a negative Wassermann and a positive Kahn reaction. A history of the clinical condition was obtainable in 40 of the cases in which the Kahn test alone was positive; 36 of these were diagnosed clinically as syphilis, and 4 were not. The authors consider that the reading of the different degrees of positivity in the Kahn test is more difficult than in the Wassermann procedure. They are convinced from clinical observations that the Kahn test may be feebly positive in non-syphilitic persons. They regard the Kahn test as more sensitive than the Wassermann method; thus in the present series 6.3 per cent. of cases of syphilis would not have been diagnosed on serological grounds if the Wassermann test alone had been employed. The Kahn test appears to give a higher percentage of positive results, particularly in latent syphilis and in treated cases. For these reasons the authors conclude that, in order to obtain a correct serological diagnosis of syphilis, the two reactions should be practised together.

409. Survival of the Leucocytes in Typhoid Fever.

C. COSTANZI (*Il Policlinico*, Sez. Med., December 1st, 1928, p. 629), as the result of the study of thirteen cases, came to the following conclusions. (1) The survival *in vitro* of the leucocytes in typhoid fever when kept in an 0.8 per cent. solution of sodium chloride is shorter than that of the leucocytes in health. Moreover, the percentage of active leucocytes is low even in the first few days of their survival, and still lower towards the end, and their amoeboid movements are always of slight extent and sluggish. (2) The duration of the survival *in vitro* of the leucocytes in typhoid patients is in inverse relation to the agglutination titre of the blood, the duration of survival diminishing as the agglutination titre increased. Thus when the titre ranged between 1 in 100 and 1 in 400 the duration was four days; between 1 in 400 and 1 in 500 three days; and between 1 in 600 and 1 in 700 two days. (3) The typhoid patients concerned in these researches always showed a neutrophil polymorphonuclear leucopenia in their peripheral blood, with relative lymphocytosis. Costanzi attributes the comparatively short duration of survival of the leucocytes in typhoid cases to the presence in the organism of the typhoid bacillus, the toxins of which may act directly on the leucocytes and injure their vitality, or indirectly on the haemopoietic organs and give rise to the production of forms with a diminished resistance. The polymorphonuclear leucopenia in the peripheral blood of typhoid patients may be due to the diminished production of leucocytes from the action of typhoid toxins on the haemopoietic organs, or to increased destruction of the leucocytes, or to a change in the distribution of the leucocytes, the polymorphonuclears being retained in the deep organs such as the spleen and bone marrow.

410. Sedimentation Rate in Acute Infectious Diseases.

H. VON ROHRBOCK (*Jahrb. f. Kinderheilk.*, December, 1928, p. 192) investigated the sedimentation rate of the red corpuscles in diphtheria, scarlet fever, and measles. Westergren's original method was used and seventy-five examinations in all were made. It was found that in uncomplicated cases of diphtheria and scarlet fever the increased rate of sedimentation which was observed at the onset soon returned to normal. Complications occurring in diphtheria gave rise to considerable oscillations in the sedimentation rate, while the acceleration of the rate in complicated scarlet fever was less marked, but in both diseases the increase in the sedimentation rate might last for weeks. Increase in the sedimentation rate after a return to normal was always found to herald the appearance of a complication. In uncomplicated measles the sedimentation rate was slow, but when the disease was complicated by tuberculosis there was an acceleration of the rate.

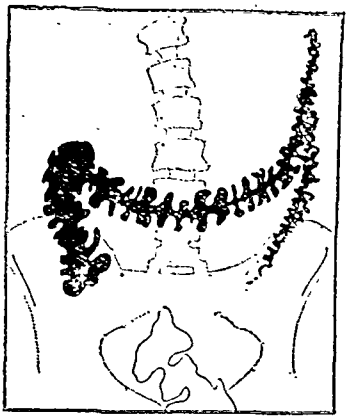
411. Interference with Growth by X Rays.

H. KRUKENBERG (*Zentralbl. f. Chir.*, February 16th, 1929, p. 387) describes an experiment made by him and Försterling on two puppies of the same litter which half an hour after birth were exposed to roentgen rays. One animal was radiated only on the posterior half of the body, and the other only on the anterior half. In the first case there was arrested growth of the hindquarters, so that the animal suggested a giraffe or hyena; in the second animal there was a small head and short forelegs, so that it resembled a rabbit. There soon developed severe cerebral symptoms, tremors, inability to feed without assistance, ataxia, standing with bestraddled legs, and progressive optic atrophy of both eyes. The observation is communicated *apropos* of a demonstration by Beck at the Vereinigung Nordwestdeutscher Chirurgen of six cases of growth interference by roentgen rays. Krukenberg's experiment was made in 1903.

412. Resistance of the Skin to Tuberculous Infection.

O. N. PODWYSSOTZKAJA and M. A. LINNIKOWA (*Zeit. f. Tuberkulose*, January, 1929, p. 474), as the result of experiments on epilated guinea-pigs by rubbing into the skin emulsions of lupus nodules, or tuberculous glands, came to the following conclusions. When small doses only were used the skin remained unchanged. On increasing the size of the dose a nodular eruption with involvement of the regional glands developed; after massive infection ulcers appeared, and finally generalized tuberculosis ensued. The authors conclude, therefore, that the skin possesses a certain degree of resistance to the tubercle bacillus and offers an unfavourable soil for its development. The virulence of the material, however, is an important factor, since the skin may form a portal of entry for infection in spite of its resistance.

Occult Constipation



Occult constipation (from an X-Ray) 24 hours after opaque barium meal. There has been one small stool as usual. Note the deep haustrations and partial dilatation of the cæcum.

THE menace of occult constipation lies in the fact that the patient may have regular daily evacuations, and is therefore unaware of the constant retention of fæcal matter, which may ultimately form a hard and deep coating on the intestinal wall, leaving but a small passage through which painful and partial evacuation takes place.

When headaches, lassitude, and the conditions usually associated with the development of intestinal toxæmia lead to the suspicion of hidden constipation, the reliance of many physicians is on AGAROL Brand Compound, *the original mineral oil and agar-agar emulsion.* Combining lubrication with softening of the fæcal mass and gentle peristaltic stimulation, AGAROL Brand Compound is particularly indicated in cases of occult constipation — because of its positive, yet gentle action, without habit formation.

AGAROL Brand Compound is the *original* Mineral Oil–Agar-Agar Emulsion and has these special advantages:

Perfectly homogenized and stable: pleasant taste without artificial flavouring; freedom from sugar, alkalies and alcohol; no contra-indications; no oil leakage; no griping or pain; no nausea or gastric disturbances; not habit forming.

SALT'S PATENT VARUS BOOT AND LEG INSTRUMENT

A Typical Case of Talipes Varus.

Illustrations, reproductions of photographs, of a boy with and without Salt's Patent Varus Boot and Leg Instrument.

Photographs were taken when boot, etc., were first applied.

The first illustration shows how the ankle goes over outwardly, so that when standing weight would accentuate mal-position.

The second illustration shows Varus Boot and Instrument applied.

It will be seen that the front of the foot has been everted by boot, the ankle being held in correct position by "T" Strap fastening over instrument.

Salt's Patent Varus Boot and Leg Instrument has been successful in over 2,000 cases of Talipes Varus.

JOHN WARD LTD

TOTTENHAM COURT ROAD
LONDON

THE CIVIL SERVICE CO-OPERATIVE TRUST, LIMITED.

Directors:
Sir HENRY J. GIBSON, K.C.B. (Chairman), late Comptroller and Auditor General.
D. H. BOGGIS-ROLFE. Major L. Sr. JOHN COLLEY. A. CARSON ROBERTS. J. CLIFFORD ROWE, J.P. Mrs. A. SAMSON.
Auditor: Sir GILBERT GARNSEY, K.B.E. (Public Auditor, appointed under the Industrial and Provident Societies Act, 1893).
Bankers: BARCLAYS BANK, LIMITED.

You are invited to become a Shareholder of this Investment Trust. As its title implies, it was formed with the particular view of providing a sound medium for the investment of the savings of Civil Servants, but there is no restriction of class, and any person may become a Member. A number of Medical Practitioners are Members.

This Trust possesses a Board of Directors which should give the Members complete confidence that there is no unsound treatment or waste of funds. It includes men of experience and distinction in finance, in the special work of Investment Trusts, the investigation of securities and accounts, and the advising of Companies, Trustees and individual investors upon their investments.

The Civil Service is represented by three men who have held the leading posts in the audit and supervision of our National, Local Government, and National Insurance accounts respectively.

As in the case of any good scheme for combined investment, the Trust provides for a good return and the prospect of an increasingly high yield with a degree of safety not obtainable by direct investment. The funds are invested in a large number and great variety of securities. The individual Shareholder, therefore, in respect of his one small holding is effecting a sort of insurance by spreading his risks over a large number of concerns.

No deduction of Income Tax is made from the dividends. Hence Shareholders are freed from the trouble and the risk of loss connected with tax reclaims. Shareholders liable to make Income Tax returns must of course disclose these dividends.

The Shares of the Trust are all of one class and of 2s. denomination with 1d. a share entrance fee. The smallest subscription allowed is of 10 shares, costing £1 0s. 10d., and the largest of 2,000 shares, costing £208 6s. 8d. Any sum between these two limits may be subscribed at the same rate in units of £1 0s. 10d. (10 shares), until the entrance fee is raised. Investment at the minimum rate is still available. Shares rank for dividend as from the first day of the month following the date on which they are allotted.

The Board is prepared to facilitate the sale of any shares of which a Member may desire to dispose so that the seller may, so far as practicable, benefit by any enhanced value.

THIS APPLICATION FORM MAY BE USED. (15)

To the Directors of THE CIVIL SERVICE CO-OPERATIVE TRUST, LIMITED,
341, WINCHESTER HOUSE, LONDON, E.C.2.

I, the undersigned, hereby apply for.....Shares of 2s. each in the above-named Trust, subject to the Rules of the Trust. I enclose a remittance for £.....:.....s.....d., being payment in full for such Shares, together with an entrance fee of 1d. per Share, and I agree to hold the same or any lesser number which you may allot me.

"The Rose Corset-Belt"
for Accurate Abdominal Support and Comfort
EXTRACT FROM THE "BRITISH MEDICAL JOURNAL," DEC. 10th, 1927—
"Visceroptosis is the cause of so much discomfort and ill-health ... and an ill-fitting or wrongly applied belt or corset may aggravate rather than diminish the subjective effects of this condition.... MADAME ROSE has for many years devoted special attention to this problem, and we have good reason to believe that she has given help and comfort to a considerable number of sufferers. We have received assurances from medical men, who have sent patients to her, that she gives personal attention to each patient, that she takes great care in adapting and adjusting the support to the particular needs of the case."
Refer your Patients also to
MADAME ROSE, 97, Mortimer St., Regent St., W.1. LANGHAM 1575.

THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

(Postal Address)—WOODBRIDGE, SUFFOLK.

Rendlesham Hall, which is open to receive patients, is essentially a Sanatorium. Its daily life and routine are that of an ordinary comfortable holiday or health resort, or of a large country house. Each patient has all the privileges of a guest consistent with the prescribed medical treatment.

Rendlesham Hall has 45 bedrooms, and about 450 acres of gardens and park. It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green.

Illustrated Booklet, giving particulars as to terms, etc., can be had on application to the

RESIDENT MEDICAL SUPERINTENDENT.

Telegrams and Telephone: Wickham Market 16.

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS,
NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary Boarders, persons suffering from incipient nervous and mental disorders, as well as certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients and voluntary boarders can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical baths, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The Seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Voluntary Boarders or Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc

For terms and further particulars apply to the Medical Superintendent (Telephone: No 56 Northampton), who can be seen in London by appointment.

THE PRIVATE GENERAL HOSPITAL, COLOMBO.

(Estd. 1923.)

(For the information of members of the profession in Ceylon and South India.)

In-patient Entrance: WARD PLACE.

Entrance to Outdoor Clinic of Specialised Departments: NORRIS CANAL ROAD.

Objects.—(a) In-patient Department.

(1) To give Medical, Surgical, Maternity, and Specialized medical relief to all classes except the indigent.

(2) To give indoor treatment to patients who are permitted to consult one or several qualified medical practitioners according to their own wishes.

(3) Special in-patient facilities to those whose incomes do not exceed Rs.300 per mensem.

(b) The Outdoor Clinic of Specialised Departments.

Open only to that section of the public whose income does not exceed Rs.200 per mensem.

The Outdoor Clinic is divided into the following departments:

(1) Clinic for Metabolic Disorders;
(2) Clinic for Nervous and Respiratory Diseases;
(3) Clinic for Heart Diseases and Electro-therapeutics;
(4) Clinic for Skin and Venereal Diseases;
(5) Clinic for Diseases of Women;
(6) Clinic for Diseases of Children;
(7) Surgical Clinic;
(8) Clinic for Eye, Ear, Throat, and Nose;
(9) Ante-natal and Obstetrical Clinic;
(10) Clinic for Tropical Diseases.

Honorary Consultants to the Clinic in the various departments are members of the staffs of the leading Institutions in Colombo, and other medical men who are specially qualified to be consulted in their respective specialties.

A small commuted fee is payable to cover consultations, laboratory examinations, and medicines, the latter given only to cases which come without the general medical practitioner's card.

As soon as satisfactory diagnosis is made, the cases are referred for further treatment to the general practitioners of the neighbourhood in which the patient resides, and will not be further advised upon without the practitioner's card of request.

The special objects of this Outdoor Clinic are:

(*a*) To promote co-operation between the general practitioners and consultants, and help the busy general practitioner in the diagnosis of the more intricate ailments among his paying patients who are not entitled to poor relief.

(*b*) To encourage the more highly qualified members of the medical profession to confine themselves to their specialties, and thereby help the general practitioner, his poorer class of patients, and the advancement of scientific medicine in this country.

Resident medical attention is also provided for within the premises for this class of patients.

The Receiving Medical Officer attends to all the Out-patients before allotment to the respective clinics.

The Nursing Staff of the Hospital is under European management.

For particulars, please apply to the Resident Medical Superintendent, or to the Secretary, Mr. D. W. WANAGURU, Private General Hospital, Colombo.

Municipal Buildings, WALTER MOON,
Liverpool, W. Town Clerk.
April 10th, 1929.

Borough of Folkestone.

APPOINTMENT OF ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited from duly qualified gentlemen for the position of Assistant Medical Officer of Health and Port Medical Officer, at a salary of £600 per annum. Candidates should have previous experience in a similar capacity.

The gentleman appointed must possess the qualifications prescribed by the Sanitary Officers Order, 1926, and will be required to devote the whole of his time to the duties of the office. He will also be required to assist in the duties of Medical Inspection of Aliens.

The post is designated under the Local Govern- ment and Other Officers Superannuation Act, 1922, and the appointment will be made subject to medical examination.

Applications, stating age, qualifications, and experience, accompanied by not more than three *recent testimonials*, and endorsed "Assistant Medical Officer of Health," should be addressed to me and delivered at my office not later than May 18th.

Town Clerk's Office, C. F. NICHOLSON,
Folkestone. Town Clerk.
April 20th, 1929.

City of Leeds.

ASSISTANT RESIDENT MEDICAL OFFICER, KILLINGBECK SANATORIUM.

Applications are invited from registered medical practitioners (male) for the post of Assistant Resident Medical Officer at the Tuber- culosis Sanatorium, Killingbeck (220 beds). Applicants must be unmarried, and preference will be given to those who have held previous Hospital appointments.

The appointment will be for one year at a salary of £250 per annum, with board, resi- dence, and laundry.

Applications, stating age and experience, together with copies of three recent testimonials, endorsed "Tuberculosis Officer," should be delivered to the Medical Officer of Health, 12, Market Buildings, Vicar Lane, Leeds, not later than the first post on Saturday, May 4th.

THOS. THORNTON,
Leeds Town Clerk.

Derby Union.

SECOND RESIDENT MEDICAL OFFICER.

Applications are invited for the appointment of Second Medical Officer (male) of the Guardians' Institution and Infirmary, which is a Major Training School for Nurses (a new Hospital of 350 beds is nearing completion). Salary at the rate of £250 per annum, with residential allowances

Two months' notice of resignation to be given, to date from the Board meeting next after the receipt of the resignation.

The appointment will be subject to the sanction of the Ministry of Health and to the provisions of the Poor Law Officers Superannuation Act, 1896.

Applications, with particulars of age, previous career, qualifications, diplomas, and certificates held, together with copies of three recent testi- monials, must be sent in on or before Friday, May 3rd.

Poor Law Offices, RALPH GRANTHAM,
Derby. Clerk to the Guardians.

Woolwich Union.

THIRD ASSISTANT MEDICAL OFFICER.

A Third Assistant Medical Officer (male) is required at the PLUMSTEAD AND DISTRICT HOSPITAL, Plumstead High Street, S.E.18.

Candidates must be doubly qualified and registered.

The gentleman appointed must have held resident Hospital appointments and have expe- rience in the administration of anæsthetics. He will be required to carry out such duties as may be assigned to him by the Medical Super- intendent, and, should occasion arise, to assist at any of the other establishments under the control of the Guardians.

Salary £300 per annum, rising £25 annually to £350 per annum, with residence and rations, subject to deductions under the Poor Law Officers Superannuation Act.

Further particulars of the appointment may be obtained by personal application to the Medical Superintendent between the hours of 10 a.m. and 1 p.m., or by letter.

Applications, upon forms to be obtained from my office, as under, upon receipt of a stamped, addressed, foolscap envelope, or by personal application, must be returned to me not later than April 29th

The appointment will be made by the Guardians at their meeting on May 16th. The gentlemen selected to appear before the Guardians will be notified, and if they have not had an interview with the Medical Superin- tendent they will be expected to call on him before that date.

By Order,
Union Offices, ARTHUR HOLDER,
Plumstead High St., Clerk to the
S.E.18. Guardians.
April 15th, 1929

Bedfordshire County Council.

ASSISTANT MEDICAL OFFICER (RESIDENT).

Applications are invited for the post of a male Assistant Tuberculosis Officer (Resident) at the Bedfordshire Sanatorium, near Bedford.

The officer appointed will be under the direction of the County Medical Officer of Health, and will be required to take part in the medical inspection of school children, etc.

Applicants must be single, registered medical practitioners, and have had experience in Tuberculosis work, experience in the medical inspection of school children, and the possession of a Diploma in Public Health, are also desir- able. The officer appointed will be required to devote the whole of his time to the duties assigned to him, and not to engage in private practice.

Salary £450 per annum, together with board, residence, laundry, and a travelling allowance of £100 per annum, free use of garage, etc.

Further particulars can be obtained from the County Medical Officer, Shire Hall, Bedford.

Applications, stating age, qualifications, and previous experience, accompanied by copies of three recent testimonials, and endorsed "Assist- ant Medical Officer (Resident)" should be sent to the undersigned not later than Tuesday, April 30th.

British Medical Bureau

(THE SCHOLASTIC, CLERICAL & MEDICAL ASSOCIATION LTD.)
(FOUNDED 1880.)

12, Stratford Place,
Oxford Street, W.1.

Tele. Address: Triform, Wesdo—London. Telephone: Mayfair {1782 1783

The Association has long been favourably known to the members of the Medical Profession as a thoroughly trustworthy and successful Agency for the transaction of every description of Medical, Scholastic and Accountancy business, and the BRITISH MEDICAL ASSOCIATION has every confidence in recommending its members to consult Mr. A. V. STOREY, the General Manager, in all transactions requiring the services of a Medical Agent.

Members of the British Medical Association may take advantage of a reduced scale of charges applicable to them.

The business undertaken by the British Medical Bureau is divided under the following heads:—

TRANSFER OF PRACTICES, PARTNERSHIPS, etc.

Medical Practitioners wishing to dispose of Practices, or desiring to take Partners, are advised to negotiate the business through the British Medical Bureau. Vendors may depend upon receiving introductions only to eligible and bona-fide purchasers. All information is treated in strictest confidence. Full and trustworthy information regarding Practices, Partnerships, etc., for disposal, supplied gratis to Purchasers.

ASSISTANTS AND LOCUMTENENTS.

Assistants and Locumtenents can be secured at short notice. It is the foremost aim of the British Medical Bureau to ensure that only the most Trustworthy and Reliable Locums and Assistants are sent out.

RESIDENT PATIENTS.

Medical Men wishing to receive Resident Patients should enrol their names on the books of the British Medical Bureau. A large number of Patients are placed yearly through this medium.

ACCOUNTANCY.

The British Medical Bureau has its own staff of fully qualified Accountants wholly engaged on medical work—i.e., Investigation of Practices for purchasers, Income Tax, Auditing Books & Accounts, etc.

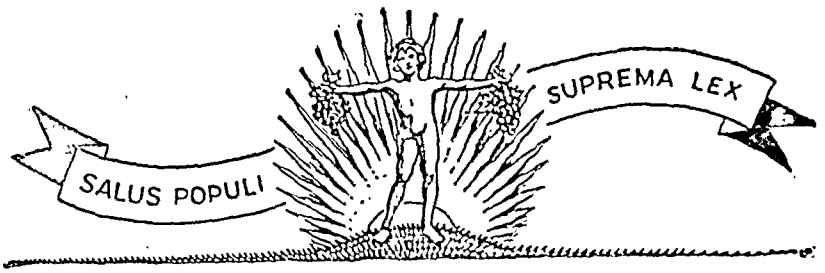
JB 96



THE ROAD TO RECOVERY.

THE Convalescent period calls for all the doctor's tact. Resistance to limitations and restraints grows stronger each day; and the patient's increasing sensitiveness and awareness make it ever more difficult to impose nauseous drugs or distasteful routine.

Apart from the prescription of suitable exercises and foods, perhaps the greatest and most general need during this important stage of illness is the regular and thorough elimination of alimentary waste, with the minimum of discomfort and physiological disturbance. For this purpose an ideal laxative is Eno's "Fruit Salt." Its superiority is shown by

1. Its invariable chemical purity.
2. Its unique physical texture.
3. Its ready and uniform solubility.
4. Its freedom from sugar and flavouring agents, as well as from harsh mineral aperients, such as Epsom and Glauber salts.
5. Its entirely local action, produced by the methods of Nature herself.
6. Its agreeable and refreshing natural taste, and its painless action.
7. Its unblemished sixty-year record—ethical and therapeutic.

"The Doctor's Emergency Reminder."

The Proprietors of Eno's "Fruit Salt" will deem it a privilege to send to any member of the Medical Profession a copy of the latest addition to their series of "Medical Reminders"—with or without a bottle of their preparation (Handy or Household size as required). "THE DOCTOR'S EMERGENCY REMINDER" summarises briefly a few points in connection with the treatment of poisoning and various other emergency cases. It is bound in black morocco limp to conform to the style of the previous publications in this series.

No. 3565. SATURDAY, MAY 4, 1929. Price 1/3

Alophen Pill

Aloin	*1/4 grain*
Phenolphthalein	*1/2 grain*
Ipecacuanha	*1/15 grain*
Strychnine...	*1/80 grain*
Extract of Belladonna	*1/12 grain*

WHEN constipation is due to torpidity of the lower bowel, Alophen Pill will be found valuable. It acts promptly and thoroughly, yet its effect is not drastic or painful. It does not over-stimulate the secretions; it does not depress the patient; and its use is not likely to be followed by intestinal torpor. Evacuation usually occurs in from 8 to 10 hours.

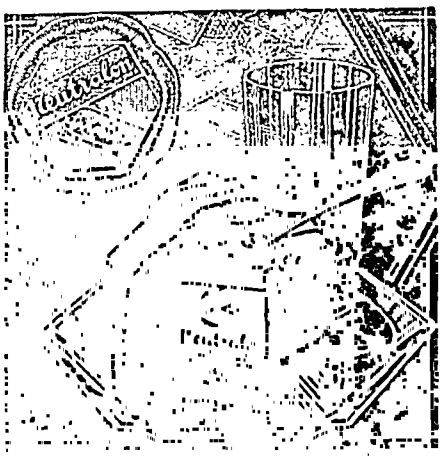
The pills being small in size, ovoid in shape and chocolate-coated, are easily swallowed. Each ingredient is of assured therapeutic value. Only the purest crystalline aloin is used; the belladonna extract is standardised, and the other drugs are subjected to chemical tests before employment.

Supplied in bottles of 50 or 500 pills.

PARKE, DAVIS & CO. BEAK STREET, LONDON, W.1

'NEUTRALON'

Rational Treatment of Hyperchlorhydria



'Neutralon' will be found of pronounced value and without secondary effects in the treatment of:—

HYPERSECRETION HYPERACIDITY GASTRIC and DUODENAL ULCERATION.

It decomposes very slowly in the stomach, leaving sufficient acid for the normal functioning of the digestive processes and for asepsis of the small intestine. In ulceration 'Neutralon' forms a protective coating on the affected surfaces. It causes no irritation and no hyperacid reaction.

Boxes of 3½ ozs. *Dose:*—Half to one teaspoonful three times daily stirred in water or milk.

In cases complicated by vagotonic symptoms Belladonna-'Neutralon' is indicated.

Clinical specimen and full literature on request from—

The Issue of the BRITISH MEDICAL JOURNAL is this week 80,000 copies.

LEWIS'S PUBLICATIONS

With 26 Plates (including 6 Coloured) and other *Illus.*, *15 Diagrams* and 34 Charts. Demy 8vo. 30s. net; post. 9d.

A TEXT-BOOK OF INFECTIOUS DISEASES

Being the Third Edition of Goodall & Washbourn's MANUAL OF INFECTIOUS DISEASES.

Revised and in large part rewritten by E. W. GOODALL, *O.B.E., M.D., B.S.*Lond., lately Medical Superintendent and Lecturer on *Infectious Diseases* and Fever Hospital Administration at the North-Western Hospital of the Metropolitan Asylums Board; Vice-President (formerly President) of the Section of Epidemiology and State Medicine of the Royal Society of Medicine, etc.

"The clinical part of the volume *touches a point of excellence which we seldom meet with in text-books.* . . . We need scarcely say that we most heartily recommend the book to all students and practitioners of medicine."—THE MEDICAL OFFICER.

With 186 Illustrations, included in *93 Plates* (*1 Coloured*) and the Text. Demy 8vo. 25s. net; postage 9d.

CHRONIC (NON-TUBERCULOUS) ARTHRITIS

PATHOLOGY AND PRINCIPLES OF MODERN TREATMENT

By A. G. TIMBRELL FISHER, M.C., F.R.C.S.(Eng.), late Hunterian Professor, Royal College of Surgeons of England; Assistant, Surgical Unit, University College Hospital; Author of "Internal Derangements of the Knee-joint" and "Treatment by Manipulation," etc.

"Mr. Timbrell Fisher has established the existence of *facts hitherto unknown*, and has made valuable contributions to our knowledge."—BRITISH MEDICAL JOURNAL.

Crown 8vo. 7s. 6d. net; postage 6d.

A MANUAL OF GENERAL MEDICAL PRACTICE

By W. STANLEY SYKES, M.A., M.B., B.Ch.Cantab., D.P.H.Leeds, M.R.A.S., late House Surgeon and Extern Midwifery Assistant, St. Bartholomew's Hospital.

"Contains a variety of information of practical value."—THE LANCET.

THIRD Edition. Foolscap 8vo. *10s. net*; postage 4d

LONDON HOSPITAL LECTURES ON

FORENSIC MEDICINE AND TOXICOLOGY

By the late F. J. SMITH, M.A., M.D.Oxon., F.R.C.P.Lond., F.R.C.S.Eng. Revised by G. JONES, M.B.Oxon., M.R.C.S., D.P.H.

"Students should be grateful to the Editor, who, in bringing the book up to date, has preserved its value for another generation."—ST. BARTHOLOMEW'S HOSPITAL JOURNAL.

NEARLY READY. With 33 Illustrations. 7s. 6d. net; postage 5d

CANCER

A Practical *Resume of the Subject* for General Practitioners.

By G. JEANNENEY, Professor in the Faculty of Medicine; Surgeon to the Hospital of Bordeaux, etc. Translated by JOHN GIBSON, M.C., M.A., M.D., etc., and JOHN H. WATSON, M.B., B.S., F.R.C.S., etc.

THIRD Edition. Leather 12s. net; postage 5d.

GOULD & PYLE'S

POCKET CYCLOPEDIA OF MEDICINE AND SURGERY

Based upon the Fourth Edition of "Gould and Pyle's Cyclopedia of Practical Medicine and Surgery." Revised by R. J. E. SCOTT, M.A., M.D., New York.

"A handy little volume, reference is easy."—BRITISH MEDICAL JOURNAL.

THIRD Edition. Brought fully up to date and based on Modern Principles. *With 52 Plates*, including 58 figures. Demy 8vo 35s. net; postage 1s.

THE DERMATERGOSES OR

OCCUPATIONAL AFFECTIONS OF THE SKIN

Giving Descriptions of the Trade Processes, the responsible agents and their actions.

By R. PROSSER WHITE, M.D.Edin., M.R.C.S., President of the Certifying Factory Surgeons' Association, Life Vice-President, Consulting Dermatologist, Royal Albert Edward Infirmary, Wigan, Ex-President of the London Dermatological Society, etc.

". . . a most valuable encyclopædia. . . . There are few more complete compilations in any special subject in the domain of British medicine."—THE LANCET.

"The hall mark of a good monograph . . . it is a fine book, a very fine book."—BRITISH JOURNAL OF DERMATOLOGY & SYPHILIS.

THIRTEENTH Edition Thoroughly Revised. With 9 Col. Plates and 278 other Illus. Demy 8vo. *21s. net; post. 9d.*

SWANZY'S HANDBOOK OF

DISEASES OF THE EYE AND THEIR TREATMENT

Revised and Edited by LOUIS WERNER, M.B., F.R.C.S.I., Sen. Mod., Univ. Dub.; Surgeon, Royal Victoria Eye and Ear Hospital; Professor of Ophthalmology, University College, Dublin; and Examiner in Ophthalmology, Dub. Univ.

"Swanzy's text book undoubtedly remains one of the best. One of the features of this volume is the excellence of the illustrations."—THE LANCET

GOULD'S DICTIONARIES

SECOND Edition. With many Tables. Bound in Flexible Leather, Marbled edges. 10s. 6d. net.; postage 1s (inland), 2s. (abroad).

MEDICAL DICTIONARY

Containing all the Words and Phrases generally used in Medicine and the Allied Sciences, with their proper Pronunciation, Derivation, and Definition. By G. M. GOULD, A.M., M.D. Edited by R. J. E. SCOTT, M.A., B.C.L., M.D.

THEIR DIAGNOSIS, PROGNOSIS AND TREATMENT BY MODERN METHODS.

With chapters on the Ink Polygraph, Clinical Electro-Cardiography, X-Ray Examination, and Anæsthesia in relation to Cardio-Vascular Affections.

By FREDERICK W. PRICE, M.D., F.R.S.(Edin.),

Physician to the National Hospital for Diseases of the Heart; Consulting Physician to the Royal Northern Hospital, London.

Demy 8vo. Pp. 534. With 249 text figures, including 32 sphygmograms, 92 polygraphic tracings, and 87 electro-cardiograms.

NEW SECOND EDITION, 21s. net.

"By great care and by the use of an amazing amount of material, he has accomplished what many readers have been waiting for, giving us a complete account of the diagnosis, prognosis, and treatment of heart diseases by modern methods in association with all the invaluable teaching bequeathed to us by the older masters of clinical observations."—LANCET.

"The most valuable and comprehensive guide to the study of Cardiology with which we are acquainted."—NEW YORK MEDICAL JOURNAL AND RECORD.

"The book presents a comprehensive account of modern knowledge of cardiology."—BRITISH MEDICAL JOURNAL.

"In our opinion the book is indisputably the most authoritative contribution to Cardiology of our time."—FRANCO-BRITISH MEDICAL REVIEW.

"A book which we believe is destined to remain the standard work on Cardiology for many years to come."—AMERICAN MEDICINE.

"The second edition of this popular work on heart diseases bears evidence of thorough revision, while the essentially clinical standpoint of the writer is maintained."—EDINBURGH MEDICAL JOURNAL.

"It may be said at once that the book adequately fulfils the purpose it has in view and is a perfectly sound, lucid, and reliable guide."—NEWCASTLE MEDICAL JOURNAL.

"Well-written, concise, and complete, containing a wealth of practical information. Obviously based upon the author's own experience and investigative work."—SURGERY, GYNECOLOGY AND OBSTETRICS (Official Journal of the American College of Surgeons).

"Dr. Price is to be congratulated again on the reappearance in its second edition of his distinguished contribution to the increasingly important subject of Cardiology."—THE CANADIAN JOURNAL OF MEDICINE AND SURGERY.

Science & Personality
By William Brown

M.A., M.D., Oxon., D.Sc.(Lond.)

Wilde Reader in Mental Philosophy in the University of Oxford; Psychotherapist to King's College Hospital, London

With a foreword by Sir OLIVER LODGE

12s. 6d. net.

A sequel and completion of the Author's previous book, *Mind and Personality*. Although much of the discussion is abstract and philosophical, it is based upon scientific evidence gained by close and prolonged observation, in hospital and consulting room, of disturbances of human character and conduct.

OXFORD UNIVERSITY PRESS

BAILLIÈRE, TINDALL & COX

Thoroughly Revised, with the addition of Two New Chapters.

SECOND EDITION

Bigger's Bacteriology

Price 12s. 6d.

"... In this book the author has succeeded admirably in expounding the principles of bacteriology free from the confusion of its many special refinements."—*Guy's Hospital Gazette.*

"... It can be confidently recommended to those wishing to obtain a well-written sound book of bacteriology of a reasonable length."—*St. Bartholomew's Hospital Journal.*

Size 8 in. × 5½ in. Pp. xvi + 452, with 5 Coloured Plates and 82 other Illustrations.

Revised and Enlarged, with new Illustrations and Coloured Plates.

FOURTEENTH EDITION

Green's Pathology

Price 21s. net.

"Green's Pathology is, and has been for many years, a favourite with students, and this new edition will serve to add to its value. The illustrations are profuse and good and the student can want no better guide to an understanding of what is always a difficult and confusing subject."—*Middlesex Hospital Journal.*

Demy 8vo. Pp. viii + 650, with 261 Illustrations and 9 Coloured Plates.

"It contains more than enough to get a man through any examination."—*St. Bartholomew's Hospital Journal.*

FIFTH EDITION

Buchanan's Anatomy

Price 35s.

Revised and Edited by the Committee of Teachers in Anatomy.

"We can cordially and confidently recommend it, not only as a reliable and helpful guide through the dangers of the examination room, but also as a practical book of reference throughout the years of professional life."
—*British Medical Journal.*

Demy 8vo. Pp. xvi + 1,702, with 810 Illustrations, plain and in colour.

"The best text-book of Surgery in English."—*Lancet.*

TWELFTH EDITION

Rose & Carless' Surgery

Price 30s.

"As a standard work on its subject it should be in the hands of every student, who will find everything set out in a full and interesting manner, devoid of surplus packing, and with the essential facts well emphasized."
—*Durham University Gazette.*

Demy 8vo. Pp. xii + 1,554, with 19 Coloured Plates, an X-Ray Supplement containing 78 Photographs and 639 other Illustrations, and an appendix on Military Surgery.

Faulty Posture Should be Corrected

When there seems to be no direct cause for headaches, it is well to find out whether poor posture is a factor.

Insufficient abdominal support, bad habits and "styles" of sitting and standing, occupational strain, and child bearing, make lordosis posture *exceedingly common among women of all ages* and classes.

The woman who fails to see that the sway-back and sagging abdomen of lordosis posture are *disfiguring* is not likely to think of the deleterious effect of bad posture *upon* health.

Yet, physicians generally recognize that lordosis posture predisposes to enteroptosis and *constipation*. That it causes backache and head-ache. That it tends to create depression and other nervous symptoms. That it induces sacro-*iliac* strain. That in extreme cases it narrows the birth canal, both at the inlet and the outlet.

Orthopædists agree that lordosis *can* be improved or corrected by improving postural *habits, with the help of rest in bed, and by the* wearing of a proper support.

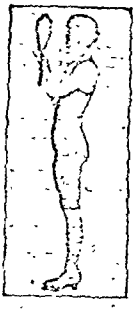
Spencer Supports are designed to *correct* faulty posture. Each garment is especially designed and made to meet the needs of the person who is to wear it.

Call the Spencer Corsetière by telephone, *or* write direct to *us for information about* Spencer Supports.

We should like to send you our booklets on the use of Spencer Supports for maternity wear, hernia, enteroptosis, floating kidney, sacro-iliac strain.

THE X-RAY REVEALS

the effect of incorrect posture



A.—Uncorseted figure —lordosis posture. *Note* the sagging abdomen and the deeply curved back.

B.—Correctly corseted with a Spencer. Note the improvement in *posture*.

(Left.) X-ray of model *shown* in figure A. Stomach three inches below crest *of* hip bones.

(Right.) Same model, posture corrected and abdomen supported by Spencer Corset. Note improvement in position of Stomach.

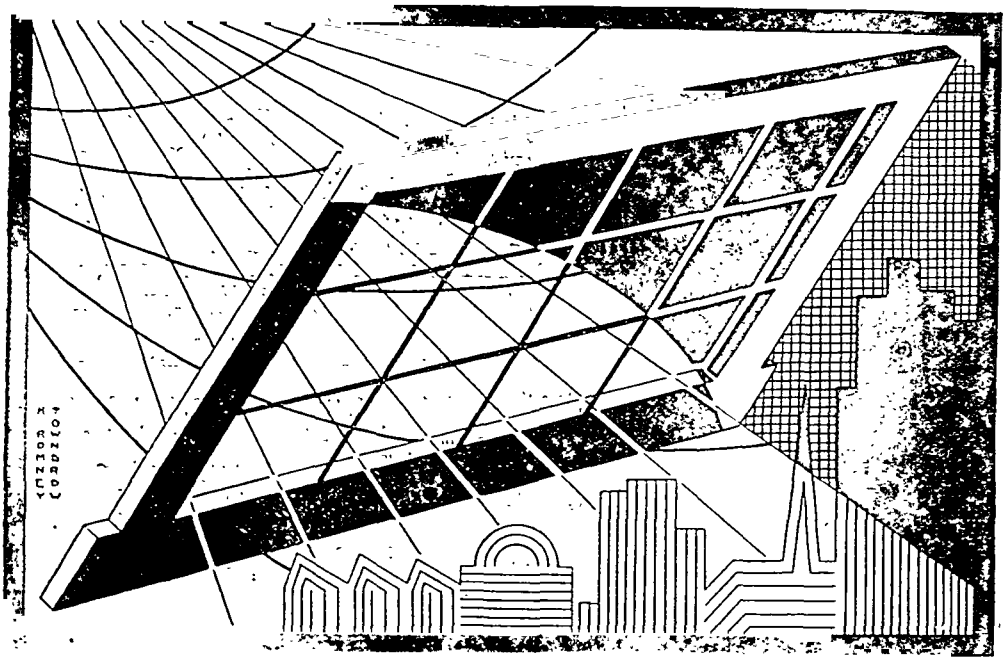
IN all those cases which require more than ordinary consideration, bring the "METALIX = PORTABLE" to your aid. Successful radiograms are assured from the start. There are no dangers and nothing to go wrong. At the patient's house or in the consulting room, the apparatus can be used with equal facility. You should write for the book. It tells of the possibilities of the "METALIX = PORTABLE" in *your* practice.

PHILIPS LAMPS LTD. (X-RAY DEPT.), PHILIPS HOUSE, 145, CHARING CROSS ROAD, LONDON, W.C.2



TAKING DOWN THE SHUTTERS TO HEALTH

"Vita" Glass and the New Hygiene of Light

The ultra-violet rays of daylight—rays potent to build up disease-resistance and bodily vigour—can stream unchecked through windows glazed with "Vita" Glass. Ordinary glass totally excludes the tonic rays: "Vita" Glass is the only British window glass that lets them through.

This power of "Vita" Glass to transmit ultra-violet radiation is permanent. After a few months it is completely stabilised and operates as a health measure every daylight hour, whether the room faces North or South.

The medical practitioner will find "Vita" Glass useful where the patient is returning to convalescence after a long debilitating illness. In circumstances where the patient is too weak to be moved, or weather conditions render such a course impracticable, "Vita" Glass offers a simple means of bringing sunlight indoors under sheltered conditions.

No great expense is involved by this measure to-day. For an average-sized bay window in a modern house, the "Vita" Sheet Glass costs about 38/-, plus the cost of fixing.

Write for full information and prices from the "VITA" GLASS MARKETING BOARD, 9 Aldwych House, London, W.C.2.

"Vita" Glass is obtainable from local Glass Merchants, Plumbers, Glaziers or Builders.

Prescribed in numerous cases of *nervous and heart disorders, also rheumatic conditions,* etc.

The active substances of the extracts from cone bearing pine trees (Pinus silvestris, Abies alba, Pinus montana) is found in an oily substance commonly known as pine oil.

Novopine Sparkling Pine Bath Tablets contain this oil in a convenient form and an effervescence is introduced to facilitate successful solution in the bath. Their therapeutic value lies in their action on skin, lungs, and heart For, in addition to the direct action through the pores of the skin, the ozonic aroma given off is automatically inhaled during the taking of a hot bath.

Besides their general cleansing and health-giving properties, they have been found especially beneficial as a remedy against nervous heart diseases and kindred disorders.

Samples on request from Natural Products Ltd., 40, Furnival Street, E.C.4.

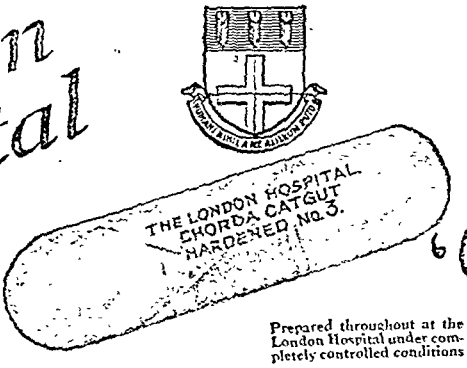
The London Hospital



'Chorda' Catgut

Prepared throughout at the London Hospital under completely controlled conditions

After extensive experimental work in the London Hospital, 'Chorda' Catgut has been evolved. This catgut is sterilized by a special iodine process which obviates the disadvantages hitherto associated with iodine sterilization.

Thus, while ensuring complete sterility, the tensile strength of the ligature is not impaired. Most of the iodine being finally removed in the process no irritation is produced by the ligature in the tissues.

Prepared in all sizes from 6·0 to 6 in both plain and hardened.

5 - per box of 3; 18'- per box of 12 tubes. When ordering please specify '*Chorda*' *Catgut*.

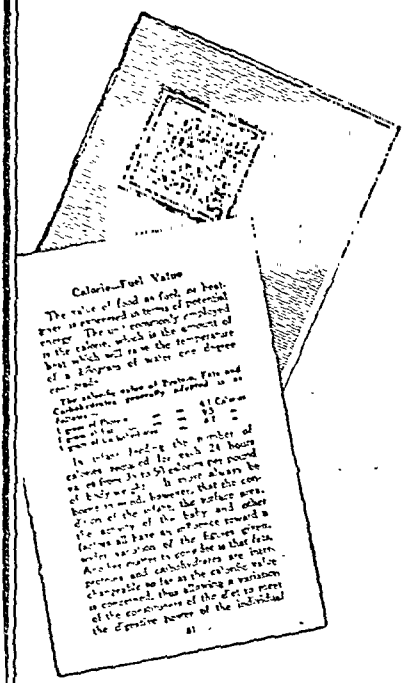
C.M.S.



Mellin's Food

affords for the hand-reared infant three distinct advantages.

Firstly, where it is used there is much less danger of producing digestive disturbances, for it is well tolerated and easily assimilated.

Secondly, where conditions of intestinal irritation and the resultant diarrhœa have been produced by the use of other foods, Mellin's Food enables the physician at once to bring the diarrhœa under control.

Thirdly, it facilitates the digestion of cow's milk.

TO MEMBERS OF THE MEDICAL PROFESSION.

The pamphlet "Modified Milk in Infant Feeding" will be forwarded with samples post free upon application to:—

MELLIN'S FOOD Ltd., LONDON, S.E.15

The Medical Profession when prescribing "Liquor Carbonis Detergens" SHOULD ADD THE WORD

Wright's

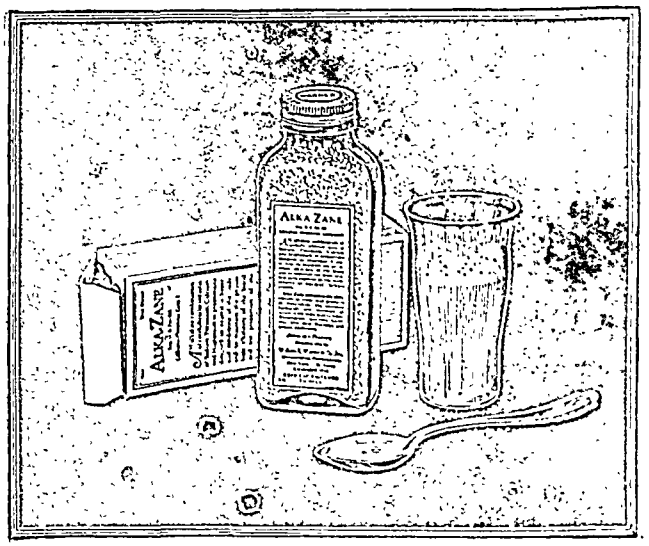
On receipt of your professional card a package will be sent containing a sample of each of the following—

Wright's Coal Tar Soap.
Wright's Coal Tar Ointment.
Wright's Lysol.
Wright's Liquor Carbonis Detergens.

Although there is no secrecy as to the composition of Liquor Carbonis Detergens (it is described as "an alcoholic solution of coal tar"), the method of manufacture is unique. Imitations will be found to be produced by simple digestion, usually accompanied by some primitive, perfunctory, and inadequate stirring; whereas, in the case of the genuine product, the intimate contact required, for the complete extraction of all the soluble antiseptic constituents, is attained by a series of complicated processes, involving the use of highly specialized machinery.

WRIGHT, LAYMAN & UMNEY LTD., 66, Park Street, Southwark, S.E.1

Immunity and Alkalinity



A pleasant, effervescent granular preparation composed of carefully selected salts of Sodium, Potassium, Calcium and Magnesium in physiologically correct prop r ions.

appear, in the opinion of competent observers, to be in close relationship. At least it is certain that alkalinity is lowered in all infectious diseases, and that excess production or defective elimination of acid products lead to a number of metabolic disturbances.

To correct these conditions, present particularly in gastric and intestinal disorders, rheumatism, gout, and certain cutaneous affections, and to prevent their occurrence as a sequel to undue reduction of the buffer substances of the blood, prescribe

ALKA-ZANE

Literature and samples to physicians on request.

Prepared by WILLIAM R. WARNER & CO., INC.,
Manufacturing Pharmacists Since 1856.

Bismuth-Formic-Iodide Compound
Mulford B-F-I

Supplied in 2 sizes in sprinkler-top tins.

Bismuth-Formic-Iodide Compound, now well known as "B-F-I", is a medicated dusting powder possessing soothing, astringent and antipruritic properties. It is a safe, dry dressing that promotes healing and has been widely used for thirty years by physicians and in hospitals.

B-F-I has the capacity for absorbing fluid from the surface, thereby exerting a drying action. It does not cake or form hard crusts, which would only add to the irritation. B-F-I is, therefore, the ideal dusting powder for use wherever excoriation and a weeping surface occurs.

This compound has been found very satisfactory and effective in treating superficial wounds, eczema, impetigo, pemphigus, ulcers, burns, abscesses, vaccination area, bed or fever sores, chafing, abrasions and similar skin irritations.

KOLYNOS
DENTAL CREAM

(Made in England)

The properties desirable in a dentifrice have been specified as follows, viz.:

Antiseptic.	Harmless to Mucous Membrane.
Pleasant Flavour.	Non-poisonous to the user.
Mildly Alkaline.	Must not alter reaction of the Saliva.
Contains Chalk as an Abrasive.	Must not destroy Salivary ferments.
Contains Soap as an Emulsifier.	Must not inhibit the secretion of the Saliva.

Twenty years of varied and painstaking laboratory experiments with the wide and ever-increasing endorsement of the profession have demonstrated that these qualities are embodied in Kolynos Dental Cream.

Write TO-DAY for free professional samples, literature, etc.

KOLYNOS INCORPORATED

(Laboratories and Offices)

CHENIES STREET, LONDON, W.C.1

KOLYNOS DENTURE POWDER

An entirely new preparation for effectively cleaning artificial teeth. Can be used on the most delicate dental plate with complete safety and satisfaction.

Antiseptic. *Convenient in use.*

Prescribe 'Mistol' for the Nose and Throat.

MISTOL has proven especially efficacious in coughs and colds, simple, congestive, and catarrhal rhinitis, hoarseness, bronchitis, and laryngitis.

Mistol consists of menthol, eucalyptol, and camphor carefully combined in proportions recommended by leading nose and throat specialists. A specially prepared petroleum base keeps the soothing, healing ingredients in direct contact with the mucous membrane for a considerable length of time. Moreover, it prevents it being easily washed away by the natural secretions.

Mistol and the Mistol Dropper are a real advance in nose and throat therapy. With head tilted back, the patient should let Mistol drop into each nostril until it is felt to be running into the back of the throat. Unlike douches, Mistol avoids any possibility of sinus trouble. It is manifestly superior to salves which do not reach all parts of the mucous membrane.

Sold in original sealed cartons containing a—

OVALTINE

PHOSPHORUS IN NEURASTHENIA

Although it is realized that much difference of opinion prevails in medical circles as regards the therapeutic value of phosphorus, it is not illogical to claim that where the element is indicated, as in the neurasthenias, its tonic and restorative effects are more likely to be produced from natural phosphorus nutrients, such as those in "Ovaltine," than from medicinal products.

In the majority of cases in which "Ovaltine" has been prescribed for its "phosphorus" effect—that is, for its tonic and restorative effect upon the nervous system—the results of its administration have been gratifying in the extreme.

"Ovaltine" has been used with marked success in neurasthenia of the type known as cerebral neurasthenia, or psychasthenia, a variety of which is induced by excessive mental labour, or by worry, anxiety, or nervous strain.

The delicious flavour of "Ovaltine" renders the product acceptable even to the most fickle or jaded palate, while its exceptional nourishing qualities exert a profound influence for good health.

A liberal supply for clinical trial sent free on request.

Bowel Infection

in

DISEASES OF THE NERVOUS SYSTEM

A generation ago the origin of diseases of the nervous system presented for the most part a tangle of insoluble medical problems. The scientific worker of to-day, however, has so far cleared a way through the jungle as to make its ultimate conquest a certainty. In disorders of the nervous, as of other bodily systems, the overwhelming part played by toxæmic agencies has become generally recognised.

> "The first routine duty of the physician called upon to face nervous symptoms in which there is no known cause, such as arsenic, lead, or alcohol, is to search for a focus of infection. In some cases this will be found in the nasal cavity and its accessory sinuses, or in the mouth or pharynx, but in the great majority the seat of mischief lurks in the bowel. Should constipation and anæmia be associated with otherwise obscure nervous symptoms, there need be little hesitation concerning the diagnosis, and still less about the treatment. Bowel toxæmia proclaims itself in the boldest of type and the experienced physician often recognises auto-intoxication at a glance. Happily, in all such cases, now that the problem of intestinal disinfection has been solved by the introduction of the benzene derivative Dimol, it is possible to clear out the immediate cause of the trouble *in situ*."
>
> ———, M.D.(Ed.), Cavendish Square, W.1.

A new era in the treatment of many diseases of the nervous system is thus opened up by the discovery of this benzene derivative. With the introduction of Dimol, the *bactericidal equivalent* of 140 grains pure phenol can be administered four or five times a day without affecting the mucosa or producing any toxic effect whatever.

Samples and Literature will be sent on application to the

Dimol Laboratories, Limited, 40, Ludgate Hill, London, E.C.4

Dietetics and Disease

"To the Chief Medical Officer of the Board of Education it appears that the child who is in a chronic state of subnormal health now constitutes one of the most serious problems of the School Medical Service."—(Lancet, April 13, 1929, p. 792.)

Statistics show that a considerable percentage of children of school age are prevented from attendance on account of tubercular trouble, of general debility and of complaints connected with vitamin deficiency.

From the accumulated evidence on the subject it is obvious, since the average diet is usually lacking in vitamins, that the addition of a suitable extra-dietary vitamin preparation is required for the prevention and amelioration of the many troubles associated with deficiency diseases.

Radio-Malt is the ideal preparation for this purpose because it contains vitamins A, B_1, B_2 and D ***in scientifically-standardised amounts;*** its value in the prophylaxis and treatment of many diseases is appreciated universally by physicians. Radio-Malt promotes healthy growth, and corrects faulty calcium and phosphorus metabolism ensuring proper development of bones and teeth; also there is evidence as to its value in the treatment of tuberculous and run-down conditions in patients of all ages.

On the Absorption of Sanatogen

Why it is that Sanatogen is absorbed with ease even by the weakest stomach.

The tonic influence of the glycero-phosphoric-acid in the chemical combination casein-sodium glycerophosphate (Sanatogen) makes the use of casein possible in cases where the patient has to a great extent lost his capacity of absorption (Tunnicliffe, Tischer-Beddies, Chajes, a.o.).

French authorities (Robin and others) ascribe to the glycero-phosphates a great influence on the utilization of the albumin in the body. The manufacture of Sanatogen is conducted under the strictest scientific control ensuring absolute purity, sterility and uniformly high dietetic value.

Samples and Literature will gladly be sent on request to:

GENATOSAN LTD., LOUGHBOROUGH, LEICESTERSHIRE.

Calcium Deficiency in Expectant & Nursing Mothers

Pregnancy and lactation often produce manifestations of calcium deficiency because the calcium reserve cannot meet the demands made upon it. The systematic use of Kalzana in these cases stays the destructive processes in the teeth and bones of the mother, and ensures normal development of the skeletal structure of the infant. The special feature of Kalzana is that it combines calcium lactate and sodium lactate in the form of a double salt, with the result that the sodium element improves the blood alkalinity to the extent necessary to ensure adequate calcium retention.

"The Practitioner" says:

"Kalzana acts efficiently in promoting the growth of strong bones and healthy teeth, in protecting the expectant and nursing mother against a dangerous loss of calcium . . . . particularly because Kalzana promotes calcium retention."

Dispensed by Chemists in air-tight packets containing 50 and 100 tablets.

Kalzana

calcium-sodium-lactate

Also supplied *direct* for Doctor's own dispensing at 15/- per 1000 plain tablets.

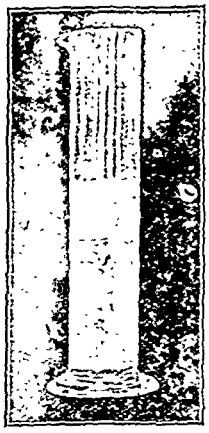
'Allenburys' The DIET

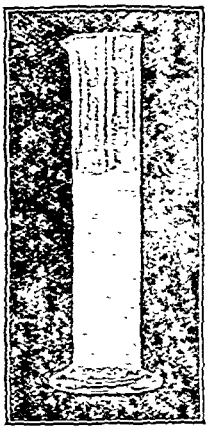


A Showing the heavy curd formed by the action of gastric juice on ordinary cow's milk.

A Stimulating and Sustaining Food Beverage

A solution to the problem of feeding in many acute and chronic affections is found in the use of the 'Allenburys' Diet, which presents distinct advantages over cow's milk both with regard to food value and digestibility. The 'Allenburys' Diet is a palatable and highly nutritive food beverage prepared from pure fresh full-cream milk and whole wheat, and is particularly easy of assimilation. It replaces with advantage milk and the milk dishes commonly employed in sickness and convalescence and can often be taken and retained where other foods are rejected. As a stimulating and sustaining beverage for people of all ages, it is infinitely superior to tea, coffee, etc. It can be made in a minute simply by adding either boiling water or milk.

In tins at 2/1, 4/- and 7/6.



B Showing the finely flocculent curd formed by the action of gastric juice on the 'Allenburys' Diet.

Descriptive Literature and free clinical sample will be gladly sent on request.

Local Anæsthesia in Surgical Practice

CLEFT PALATE.

Typical Case.

E. M., aged 25 years.

Diagnosis: Cleft palate.

Operation: Plastic repair.

Anæsthesia: Novocain-Adrenaline solution.

Operation: Nerves were blocked with a 2 per cent Novocain-Adrenaline solution, 30 c.c. in all being used. In addition to the nerve block, an effort was made to separate the soft tissues from the bone by the "blowing-off" process. This was signally successful, the subsequent raising of the mucoperiosteum being greatly facilitated by this preliminary manœuvre. The palate united completely with the exception of an opening the size of a lead-pencil at the mid-point. This opening was later closed after making a local infiltration with Novocain-Adrenaline solution.

—Extract from PRACTICAL LOCAL ANÆSTHESIA (Farr).

(Full technique of this and one hundred other operations under Local Anæsthesia will be found in the above work published by Henry Kimpton, 263, High Holborn, London, W.C.1.)

THE SAFEST LOCAL ANÆSTHETIC.

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals. Specify "Novocain" for your next operation.

Does not contain Cocaine, and does not come under the Dangerous Drugs Act.

The Complete Antiseptic

Monsol differs radically from all other antiseptics on the market. It attacks *all* germs, whether surface or deep seated, without irritation or injury to the most delicate tissue. Such is its great germicidal power that its effect on the germs responsible for sepsis is ten times greater than that of pure phenol or lysol. Yet it can be applied in effective dilution even to mucous membranes without the slightest risk.

These powerful germicidal properties are possessed by each one of the Monsol products making them the most effective yet produced.

VACCINE TREATMENT OF GONORRHOEA

In the treatment of Gonorrhoea the use of Vaccines, in conjunction with the usual routine treatment, materially shortens the course of the disease and prevents complications.

DETOXICATED VACCINES are recommended for preference owing to the massive doses which may be administered with little or no reaction, at the same time achieving great immunity, but where price is a consideration "Ordinary" Vaccines are available at very low prices.

For all early cases of Gonorrhoea, also in cases of Gonococcal Arthritis, Orchitis, Iritis, etc., Gonococcal Vaccine "A" is indicated. This is a pure Gonococcal Vaccine prepared from many strains (Polyvalent).

In cases of more than three or four weeks duration Gonococcal Vaccine "B" is recommended. This Vaccine is composed of equal parts of the above Vaccine "A" and the organisms found as secondary invaders in chronic cases.

Practitioners desiring additional information regarding the above Vaccines and also the special Gonococcal Products for Diagnosis and Test of Cure are invited to write to:

THE VACCINE DEPARTMENT:

GENATOSAN LTD.

Diet in debility

IT has been demonstrated that many cases of illness which manifests itself mainly as debility, associated with headache, constipation, nervousness, and in severe cases recurrent (cyclical) vomiting, are due to Ketosis. This is a condition which is primarily due to disturbance of the function of the liver as a consequence of which digestion and assimilation of fat are markedly retarded or even for the time abolished. If, however, sugar is added to the diet the disease is rapidly cured.

It is evident that when fat is administered to children it should not be in a form that gives rise to derangement of the function of the liver and heart muscle, and that it should be guarded by an adequate quantity of sugar.

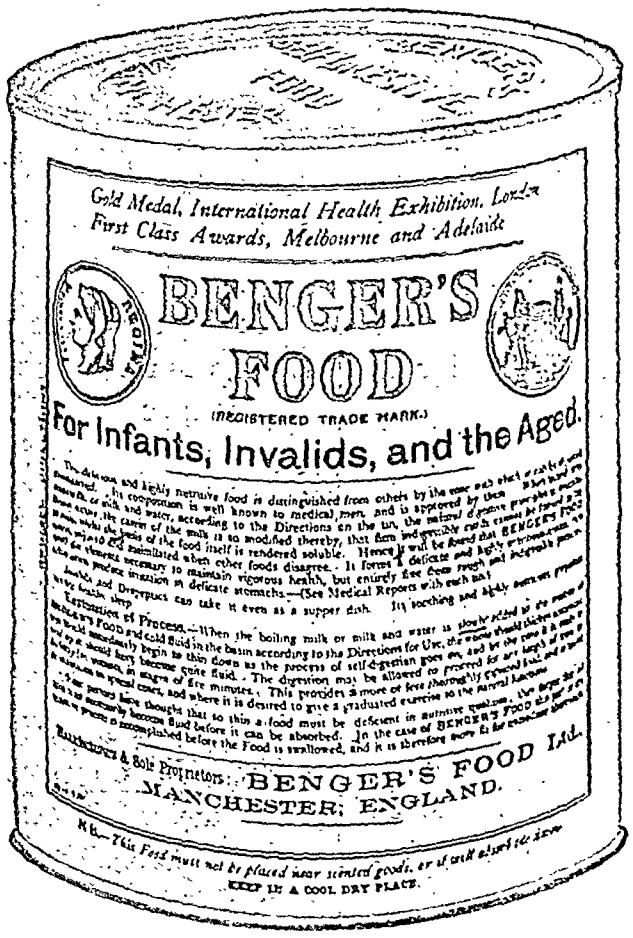
In the treatment of debility, apart from a sufficiency of protein, carbohydrates, and fats, a sufficiency of mineral salts, notably calcium and iron, and a well balanced vitamin content are of great importance.

These conditions are admirably fulfilled in Virol, which is composed of Marrow Fat, Glycerine Extract of Red Bone Marrow, Malt Extract, Eggs, Lemon Syrup, with Salts of Lime, Iron, etc., and which has been shown by independent investigations to contain all the vitamins.

The great value of Virol in debility and wasting conditions has been proved in a widespread clinical experience and by its continued use in more than 3,000 Hospitals and Clinics.

VIROL

In Jars 1/3, 2/-, 3/9. Family jars, 15/-. Virol Ltd., Ealing, London.



Benger's Food—the adjustable diet.

The "LANCET" describes it as "Mr. Benger's admirable preparation."

Owing to the presence of the natural enzymes of digestion (*Amylopsin* and *Trypsin*), and its method of preparation for a patient, the extent of self-digestion of Benger's Food and the milk with which it is mixed *can be regulated to suit the digestive powers of the patient.*

Benger's Food is prepared with fresh cows' milk. It forms a dainty cream which becomes the easier of digestion the longer it is allowed to stand after mixing. The process may be arrested at any time by simply bringing the mixture to the boil. (A useful average time for standing is 15 minutes).

Patients ordinarily unable to digest milk can take this mixture satisfactorily, as the Benger's food so softens the casein that when under the influence of the gastric juice it forms into minute flocculi instead of a heavy curd.

Benger's Food is of the highest nutrient value and is not found to pall, even when taken over long periods.

A Physician's Sample will be sent post free to any member of the Medical Profession making application to the Proprietors—

BENGER'S FOOD, LTD., Otter Works, MANCHESTER.

Benger's Food in sealed tins is on sale throughout the world by chemists, etc.

BELLE VUE SPA

TREFRIW, NORTH WALES

(Railway Station Llanrwst and Trefriw)

Telephone—LLANRWST 60. Telegraphic Address—" BELLEVUE, TREFRIW."

AMBULATORY TREATMENT LTD.

THE establishment is at Trefriw village and occupies a sheltered fold of the western slopes of the Conway Valley, about 15 miles from Llanduduo and 5 from Bettws-y-Coed. Its terraces and windows command the pleasant contours of the river and the hills.

Although on the fringe of the central mountain mass of Wales, its rainfall is no greater than that of London, and its climate is far milder. It is protected from all the colder winds; in winter there is rarely any frost or snow. Here, the facilities of an up-to-date nursing home have been combined with the comfort and cuisine of a charming country hotel, and a complete equipment has been assembled for the treatment of affections of the bones and joints by progressive modern methods.

The Spa is remarkable, amongst all other Spas both at home and abroad, for the strength and purity of its iron springs. The geological conditions are peculiar. The waters percolate from a mountain tarn a thousand feet above, and pass through deposits of pyrites embedded in the hills which shelter Belle Vue on the west. By taking advantage of ancient tunnellings left by a forgotten generation of miners, and only recently brought to light, it has been possible to tap the iron waters at their source, a considerable depth below the surface of the mountain side. They issue from the pyrite beds in a state of complete purity, the iron salts being entirely in that ferrous form appreciated by the physician and the pharmacist. They are secured before there has been any opportunity for oxidation to occur from exposure to the air, and oxidation is still further retarded by the presence of minute amounts of Sulphurous Oxide. For these reasons there is no contamination by admixture with even traces of ferric salts whose irritant and astringent properties are undesirable in waters intended for internal use.

The Chalybeate spring provides a ferrous water which is not only absolute in its purity, but unique in its concentration. It contains more than 3 per cent. of anhydrous ferrous sulphate. The equivalent of a Blaud's pill is to be found in less than one ounce. It affords a means of applying a natural iron therapy in which the dose of iron can be closely regulated. The patient need not imbibe a large volume of water in addition unless it should seem desirable for him to do so.

The method is proving invaluable in the secondary anæmias of rheumatic conditions; also in chlorosis, chronic septic anæmia, the anæmias which follow acute infection, and those resistant forms peculiar to protracted illness and chronic disease.

The Iron Springs at Trefriw are much stronger than any other pure ferrous waters in the British Isles. They are, in fact, twenty times as strong as the next in series. Abroad the strongest pure ferrous waters are at Ronneby, in Sweden; but these are only one-fifth as strong as those of Belle Vue Spa.

Many medical men have written about the curative properties of these ferrous waters in the early cases of arthritic origin, so-called rheumatism.

From my own observation I find that patients treated by my manipulative extension method derive great benefit, not only from drinking the waters as an addition to the extension cure, but also by the beautiful air, and last, but not least, the incentive to improve the blood supply by walking amongst the beautiful country surrounding Trefriw.

Also C. A. HOEFFTCKE, 7, Harley Street, London, W.1.

A British Medical Association Lecture

ON

SOME MODERN ASPECTS OF NEPHRITIS.

DELIVERED BEFORE THE SWANSEA DIVISION, DECEMBER, 1928,

BY

W. LANGDON BROWN, M.A., M.D., F.R.C.P.,
PHYSICIAN TO ST. BARTHOLOMEW'S HOSPITAL.

THE centenary celebration last year of the publication of Richard Bright's discovery caused his work to be re-examined with greater care. As with Darwin, so with Bright, a study of their own writings makes us realize how much more cautiously they expressed their conclusions than their followers have done. The disciple always tends to be more Royalist than the King. Aschoff says: "Bright himself, with characteristic caution, discussed the question of the extent to which all the symptoms described by him should be referred to primary disease of the kidneys or to primary lesions of other organs. It is, therefore, better to speak of *symptoms of Bright's disease in disorders of the kidneys* and not of Bright's disease of the kidney." He suggests limiting symptoms to the combination of toxic and inflammatory albuminuria with so-called renal oedema. This would exclude some forms of nephritis, such as granular kidney.

In general, nephritis is due to some toxic cause. I do not believe that mere exposure to cold causes nephritis in a healthy kidney, though it may exacerbate a chronic lesion which is already present. In the great war the epidemic of nephritis did not occur during the first winter when men were much exposed and badly housed; it occurred during the early spring of 1915, and there was no relationship between low temperature and the incidence of nephritis. It was then suggested that a great range of temperature was an exciting cause, but in the Boer war, when I saw the mirage at 2 o'clock in the afternoon and hoar frost at 6:30 on the veldt near Bloemfontein, cases of acute nephritis were almost unknown. On the other hand, in subsequent winters in the great war there was some agreement between low temperature and the onset of acute nephritis, because by that time there were a considerable number of men in the field whose kidneys had previously been somewhat damaged.

Adolescent albuminuria does not predispose to nephritis; MacLean tested the urine of 50,000 men in training camps and found that there was no relationship between the cases of albuminuria thus discovered and the onset of subsequent nephritis. The majority of men suffering from nephritis were free from albuminuria until a comparatively short time before symptoms of nephritis set in. We must remember, however, that some of the milder forms of toxaemic kidney may simulate adolescent albuminuria, so that a careful search should be made for toxic foci in those believed to be suffering merely from this condition—for example, in the tonsils, or the appendix, or tuberculous glands.

If the kidney is overwhelmed by a toxin there is a sheer necrosis affecting the convoluted tubules most, the loops of Henle less, and the glomeruli not at all. This is the "toxaemic kidney," where the kidney does not retain what it should excrete, but excretes what it should retain. If the toxic process is rather less severe typical acute nephritis results, in which the glomeruli share. If it is much less severe a chronic nephritis follows in which the interstitial tissues suffer more than the tubules. Geoffrey Evans has shown that even in chronic interstitial nephritis there is an inflammatory reaction. In general terms, then, the intenser the infection, the more the secreting epithelium suffers; the more chronic it is, the more the vessels suffer, and as the glomeruli are vascular tufts, they are specially involved.

Generally speaking, the toxins reach the kidney by *the blood stream*; if in addition to the toxin the actual infecting organisms, as in the multiple emboli of infective endocarditis, are carried to the kidney, a number of foci of small-celled infiltration result, each of which starts an island of nephritis, constituting focal embolic nephritis.

Sometimes, especially after tonsillitis, boils, carbuncles, and staphylococcic infections generally, it is the perinephric tissue which is first involved—a metastatic inflammation which spreads via *the lymphatics* into the kidney. This is the type of nephritis in which pain in the back is most common. Again, the infection may spread upwards from the lower urinary tract—ascending nephritis—though here too, as Kenneth Walker pointed out, it is mainly, if not exclusively, through the lymphatics of the ureter that the infection reaches the kidney.

I shall adopt the following classification of nephritis, *slightly modified from Aschoff.*

1. DEGENERATIVE GROUP.
   - (A) Acute. **Toxaemic Kidney*—such as that produced by drugs (for example, corrosive sublimate and carbolic acid) or by the toxaemias of pregnancy.
   - (B) Chronic. *Amyloid Kidney.*
2. INFLAMMATORY GROUP.
   - (A) *Glomerulo-tubular.*
     1. *Acute—ordinary acute nephritis.
     2. *Subacute—chronic parenchymatous nephritis; large white kidney.
     3. Chronic—chronic mixed nephritis or contracting kidney.

     It must be recognized that these may either follow one another in this order, or 2 and 3 may apparently arise *independently* of 1.
   - (B) *Focal Emboli Nephritis*—as seen in infective endocarditis, when the nephritis is set up by multiple emboli from the heart valves.
   - (C) *Chronic Interstitial Nephritis*—the small red or granular kidney.
3. VASCULAR GROUP.
   - (A) *Hypertonic.*
   - (B) *Senile or Atheromatous.*

Only the starred members of this list really accord with the definition of disorders of the kidney with the symptoms of Bright's disease.

To my mind the position has only been made more difficult and obscured by Volhard's introduction of the term "nephrosis," which has by some writers been so extended as to include chronic parenchymatous nephritis. I consider this term should be limited to toxaemic kidney in which there are merely degenerative changes in the tubules without any inflammatory reaction. There is marked oedema, excess of cholesterol in the blood, and massive albuminuria, but there are no cardio-vascular changes or casts. The urea of the blood remains normal, as does the globulin, but its albumin content falls as the disease progresses. Nephrosis is part of a general toxaemia, and some observers claim that when it is experimentally produced the first protein to appear in the urine may be hepatic in origin. At the necropsy a large amount of cholesterol may be found in the kidney tubules, the so-called "myelin" kidneys. Death or complete recovery is the rule, but occasionally a toxaemic kidney may lead to chronic nephritis.

Of late the tendency has been towards a secretory rather than an anatomical classification. This is really an advantage since the anatomical basis can only be established after death, when the opportunity for treatment is past.

Broadly speaking, the kidney may excrete two classes of substances: (1) those which can be of use to the body—water, salt, sugar, bile, haemoglobin; (2) those which are purely waste products—urea and allied nitrogenous substances. Against the excretion of the first group the kidney presents a threshold; it does not attempt to excrete them until their concentration in the blood reaches a certain height, for it would not do for such substances to be drained out of the body. For the second group no such barrier is needed. The secretory classification is as follows:

1. *Hydraemic Nephritis* (which broadly corresponds to chronic parenchymatous nephritis).—Here the excretion of Class 1 is involved, particularly of water and salt. The output of urea may be normal, and there will not be any retention of it in the blood. Not so with chlorides, the content of which in the blood will be raised. Oedema may be very marked, but there will be little evidence of cardio-vascular change.

2. *Azotaemic Nephritis.*—Here there is gross failure of the concentrating power of the kidney, and since the great

work of the kidney in concentration is in relation to nitrogenous waste products, and as urea is the most abundant of these, we find not only a fall of urea in the urine, but a rise of it in the blood. There is a rise from the normal 20 to 40 mg. per cent. to 80, 100, or much more in severe cases. The cardio-vascular changes tend to be very marked.

3. *Mixed Types.*—As interstitial changes, which are chiefly associated with azotaemia, proceed more slowly than the parenchymatous, which are chiefly associated with hydraemia, the former gradually alter the picture. A chronic parenchymatous nephritic either dies of intercurrent infections or passes into the contracted stage with interstitial changes; the oedema subsides, the blood pressure goes up, and the heart hypertrophies. Both sodium chloride and urea are retained in the blood. If there is both nitrogenous retention and renal oedema the case must be a mixed one.

I shall next consider some clinical features and the treatment of three leading types of nephritis—the acute, the hydraemic, and the azotaemic.

Acute Nephritis.

It is important to treat the cause of acute nephritis as soon as possible. The principal causes are:

1. *Acute Specific Fevers, such as Scarlet Fever.*—Recent observations show the great value of the administration of alkalis *in scarlet fever as a prophylactic measure against the complication* of acute nephritis.

2. *Diseases of the Respiratory Tract.*—This applies particularly to the upper respiratory tract, especially the tonsils. I recently had a case of acute haemorrhagic *nephritis associated with an infected antrum, drainage* of which was followed by rapid improvement. But Sir Thomas Horder has also called *attention to the importance of extended sepsis as well as of focal sepsis.* Thus a widespread infection of the *bronchial tubes can lead to troubles similar to those due to a small collection of pent-up pus.* This is particularly well seen *in* hyperpiesis and nephritis.

3. *Diseases of the Skin.*—Since the skin is a part of the excretory apparatus the association between diseases of the skin and of the kidney is not surprising. Extensive burns are well known to cause acute nephritis, *though here extended sepsis* is probably the chief factor. I have recently had two cases of scabies causing a staphylococcal *infection of the skin, which* were followed by acute nephritis. Here ultra-violet rays helped to clear up the skin very quickly, and the *nephritis* rapidly improved when this was achieved.

4. *Purpura.*—Here presumably the purpura and the *acute nephritis are both consequences of a common cause, but it is* not infrequent for the nephritis to occur later than the purpura.

5. *Epidemic Type.*—This is the type encountered during the war, of which I have written elsewhere. It is sufficient here to point out that dyspnoea was an early symptom, and that Shaw Dunn found multiple thromboses in the lungs. So perhaps this is really a special instance of (2), though presumably due to some unknown specific infection. According to Aschoff the renal lesion is a pure glomerulitis.

In the treatment of acute nephritis I am strongly of opinion that the conventional milk diet is a mistake in the earliest stages. Far better results accrue from von Noorden's plan of giving nothing but fruit, fruit juice, sugar, and water. If there is much hunger I generally allow toffee as well. The question of diuretics will be dealt with under hydraemic nephritis. Later on, milk can be given and the conventional treatment followed. Sufficient alkalis to render the urine alkaline seems a wise measure, and it is well to keep the patient in bed until the centrifugalized urine shows *no* red blood corpuscles *on microscopic* examination.

Hydraemic Nephritis.

There has been much controversy as to the cause of the dropsy which is the outstanding feature of this type. Widal attributed it to the retention of sodium chloride, but the results of a salt-free diet have been disappointing. Moreover, as Izod Bennett *points* out, "the same kidneys which at first secreted a urine poor in chlorides will, a week later, when oedema is subsiding, secrete a urine containing abundant chlorides." In other words, if water is retained, salt must also be retained. But I do not agree with Bennett when he says that an increase in the blood chlorides has never been demonstrated in this condition. Thus, in a recent case of mine, the blood chlorides were 580 mg. per cent., as against the normal 360 *mg., and the* urinary chlorides 150 mg. per cent., instead of 500 *mg.* I think that while retention of chlorides has been overstressed in the past it may be a factor in renal oedema.

Epstein's explanation of renal oedema involves two main factors: (*a*) there is a serious drainage of blood proteins into the urine, which may mean that as *much as 10* per cent. of these proteins are lost daily. In this way there is a fall in the osmotic pressure of *the blood, with consequent* retention of water in the tissues. *Subsequent* investigations on the osmotic pressure of proteins have supported this conclusion. (*b*) *In hydraemic nephritis* the lipoids, especially cholesterol, accumulate in the blood and tissue fluids, which he believes increases the tendency to oedema.

A recent case of *mine* showed a cholesterol content of 390 mg., falling to 250 mg. as the oedema subsided, whereas the normal lies between 100 and 190 mg. *Bright himself called attention* to the milkiness of the plasma and body fluids in nephritis with dropsy, and J. Maxwell has recently devoted attention to the subject. He showed that the cholesterol of the *plasma* is almost invariably increased in every type of renal oedema, and though not necessarily proportional to the amount of oedema *its* presence in increased *amounts is prognostic* of a chronic course. He did not think, however, that the cholesterolaemia and the oedema were related as cause and effect, but rather that both are the results of some toxic action on the tissues.

Epstein advised a high protein diet and very little fat *in such cases. It is true* that a high protein diet may sometimes greatly reduce oedema in hydraemic nephritis, but in part this is due to urea, the natural diuretic, which must be formed in large amounts from the amino-acids into which that protein excess disintegrates during digestion and before it is absorbed.

In passing, *why forbid* eggs in albuminuria, as is so often done? Now that we know how completely protein is disintegrated before it is absorbed, how can it "run through" from the bowel to the kidney? D'Arcy Power's experiments on himself are often quoted apart from the context in justification of this restriction. It is true that *he observed* albuminuria in himself on *three* occasions after he had taken a large number of eggs, but it is also true that each of these occasions was after rowing a course. Now Collier found albuminuria in each *member* of the Oxford crew of 1906 after rowing a course, and strenuous exertion is now well known to produce a temporary *albuminuria.* But it was not known to do so at the time of those experiments. Again, raw eggs may cause a slight toxic albuminuria in those sensitive to them, but this does not occur after cooked eggs. I have deliberately added *eggs to the diet of patients* with hydraemic nephritis, and have found no increase in the albuminuria produced thereby.

It naturally follows that the high protein diet is only applicable when it is certain that there is no urea retention. Mere estimation of the percentage of urea in the urine seems to me to be of little value, since so much of the urea is exogenous, coming directly from the disintegration of food proteins. Many patients with nephritis are already on a low nitrogenous diet, which will necessarily lower the percentage of urea in the urine. MacLean's urea concentration test is, however, of considerable value, since it shows whether, given a definite amount of urea to deal with, the kidney is capable of doing adequate work. I have often found that though the blood urea is normal, the urea concentration test gives too low a figure. This presumably means that the kidney can only just get along on its low protein diet, and that urea retention is just beginning. Such cases are not suitable for Epstein's [illegible]. There seems little justification for his embargo on fats, since it is only cholesterol that is concerned, and that probably not in causal relationship. Moreover, Epstein is not consistent in this, since he allows eggs, which contain cholesterol in fair amount.

It would appear, then, that Epstein's method is only of limited application to cases of hydraemic nephritis

proved to be free from nitrogen retention. Then a high protein diet may help to make good the excessive protein loss, while diuresis may be assisted by giving urea as such in doses of 40 to 60 grains three times a day. It is entirely non-toxic. Some thirty years ago it was given in large doses in tuberculosis. I doubt if it ever did any good for that disease, but it certainly did no harm, so that one need feel no scruples about using it in the type of case here described.

This brings me to the subject of diuretics in nephritis. They may act—

1. *By producing vaso-dilatation in the kidney.* The caffeine group act in this way. They probably act as direct stimulants to the renal epithelium, the vascular change being secondary.

2. *By increasing the cardiac efficiency.* The digitalis group apparently act as diuretics in this way.

3. *By increasing the quantity of circulating fluid:* (*a*) by absorption of water from the intestines, as by giving the patient large quantities of water to drink; (*b*) by increasing the osmotic pressure of the blood. The saline diuretics and urea itself act in this way attracting water from the tissues into the blood stream.

How far are these methods applicable to hydraemic nephritis? The first breaks the physiological law of resting damaged structures; I believe all the stimulating diuretics are capable of doing harm in this disease. The second is presumably only helpful when there is cardiac insufficiency as well. The third can do no harm, and may do good.

A study of the etiology of renal oedema leaves us with the impression that it is "at once suggestive of pathological changes in tissues other than the kidney" (Bennett). This is the idea underlying the use of novasurol and euphyllin as diuretics in nephritis, since they are believed to act on the tissues, enabling them to give up the water they are retaining. It is necessary to raise the hydrogen-ion concentration of the blood first by giving 1 to 2 drachms of ammonium chloride on each of two days, and then on the third day injecting 1/2 to 1 c.cm. of novasurol intramuscularly. Both parts of this treatment are usually repeated after a few days' interval. Some give larger doses of ammonium chloride and over a longer period. This plan may be adopted in obstinate cases, but it often fails. In acute nephritis I believe that 3 (*b*) is the only method that should be tried unless there is cardiac insufficiency as well, in which case digitalis may also be given.

Elimination by the skin as an alternative route of excretion has long been a common practice in nephritis. It is open to the following objections.

(*a*) Only 5 grams of nitrogen can be got rid of through the skin in the day, compared with 8 grams which can be more easily eliminated by the bowel.

(*b*) Physiological rest for the kidney is not secured by giving it a highly concentrated urine to deal with.

(*c*) Diaphoresis is an exhausting process, and may depress the heart.

(*d*) The withdrawal of so much fluid without a corresponding removal of organic solids must increase the concentration of the toxins in the circulation.

It has been argued in support of this method of treatment that after a hot-air bath the patient may be actually covered with small crystals. These are, however, chiefly crystals of sodium chloride, though there may be some urea as well. Herein we have a clue to the type of case in which diaphoresis will be of service—namely, the one when there is salt retention as a factor in the oedema, as explained above. The elimination of salt may then be of indirect service by breaking a vicious circle. In cases of this sort I have actually seen diaphoresis followed by diuresis, which can only be explained in this way. I conclude that the hot-air bath is only suitable when dropsy is actually present. Another indication that the treatment is having a good effect is the occurrence of sweating at a lower temperature than the one originally required to evoke it.

Decapsulation was revived a few years ago as a method of treatment in chronic parenchymatous nephritis by Sir Thomas Horder. It had previously been advocated chiefly for chronic interstitial nephritis, and finally abandoned for this condition. In cases of parenchymatous nephritis the following have been considered to be indications for this procedure.

(1) Persistence of the oedema for three months in spite of careful medical treatment.
(2) Absence of urea retention.
(3) Absence of cardio-vascular changes.

But even when all these indications are fulfilled the results are often unsatisfactory, and I cannot recommend this operation.

AZOTAEMIC NEPHRITIS.

When there is reason to believe that nitrogen retention is occurring the interpolation of two days of von Noorden's fruit juice and sugar diet, as mentioned under acute nephritis, may be of great benefit. I look upon this plan as comparable in value with the vegetable and egg diet in the treatment of diabetes in the pre-insulin days. After this a diet containing a restricted amount of protein should be given, and one which contains as little extractives as possible, since these give work to the kidney without providing a corresponding amount of nourishment. It is possible for an adult to maintain nitrogenous equilibrium on 1 gram per kilogram of body weight, and for a time less than this will suffice if there is nitrogen retention. This means that a man of 10 st. requires 66 grams of protein. During the epidemic of war nephritis I drew up the following two diets, the low nitrogen diet being given for the first week and the moderate nitrogen diet for the second and subsequent weeks as required. I am indebted to Miss Abrahams, dietitian to St. Bartholomew's Hospital, for recalculating these diets for me.

1. *Low Nitrogen Diet.*

Breakfast.—Milk 4 oz., porridge 8 oz., bread 2 oz., butter 1/4 oz. Fluids: Coffee 10 oz., milk 2½ oz.

Lunch.—Bread 3 oz., butter 1/2 oz., lettuce or tomato 1½ oz. Fluids: Milk 5 oz., barley water 10 oz.

Dinner.—Potato 4 oz., greens 5 oz., butter 1/4 oz., stewed fruit 4 oz., boiled rice 4 oz. Fluids: Lemonade, imperial drink, or barley water 12 oz.

Tea.—Bread 3 oz., butter 1/2 oz., lettuce or tomato 1½ oz. Fluids: Weak tea 10 oz., milk 2½ oz.

Supper.—Potato 4 oz., butter 1/4 oz., greens 5 oz., stewed fruit 4 oz. Fluids, Lemonade or barley water 12 oz.

This diet contains Protein 49 grams; carbohydrate 358 grams; fat 35 grams. Calorie value, 1,992.

2. *Moderate Nitrogen Diet.*

Breakfast.—Egg 1 oz., bread 2 oz., butter 1/4 oz. Fluids as in No. 1 diet.

Lunch.—Bread 4 oz., butter 1/2 oz., tomato or lettuce 1 oz. Fluids as in No. 1 diet.

Dinner.—Mutton or fish 3 oz., bread (alternate days) 2 oz., butter 1/4 oz., stewed fruit 4 oz. Fluids as in No. 1 diet.

Tea.—Bread 4 oz., butter 1/2 oz., tomato or lettuce 1 oz. Fluids as in No. 1 diet.

Supper.—Greens 2 oz., potato 3 oz., bread 4 oz., butter 1/2 oz., stewed fruit 4 oz. Fluid: Milk 5 oz.

This diet contains (on average): Protein 63 grams; carbohydrate 407 grams; fat 91 grams. Calorie value 2,772.

These diets have proved suitable in the experience of other observers also. Alcohol is certainly undesirable in azotaemic nephritis.

It is generally recognized now that there are decided dangers in lowering the raised blood pressure in azotaemic nephritis by means of vaso-dilators. The rise of blood pressure is compensatory and should only be treated by such methods as help in eliminating the toxins whose action is forcing the pressure up. For this purpose I find the internal administration of tincture of iodine as useful as anything. Sometimes a small dose, say 1/2 grain, of thyroid extract twice a day will help this. Gentle exercise in the open air will also assist in the physiological lowering of blood pressure.

The necessity for a raised blood pressure in this type is illustrated by the case of a man admitted under my care with chronic interstitial nephritis and much dyspnoea. His blood pressure was 160 mm. systolic and 100 diastolic. On 15 minims of tincture of digitalis three times a day his blood pressure rose to 200 mm. systolic and 125 mm. diastolic, while his blood urea fell from 100 to 40 mg., and his general condition greatly improved. Evidently his blood pressure on admission was too low for due elimination of nitrogen by his defective kidney, and it had fallen

through cardiac insufficiency. When the condition of the heart was improved by digitalis it was able to cope more successfully with the necessities of the situation. In such a case to lower blood pressure is to court disaster.

A case of azotaemic nephritis may terminate through failure of the pump, the tubing, or the filter; in other words, through heart failure, rupture of a vessel as in cerebral haemorrhage, or uraemia.

Uraemia.

What signs and symptoms can rightfully be included under this heading? Personally, I should exclude the diarrhoea and vomiting, which may be regarded as alternative methods of excretion. I have already pointed out that 8 grams of nitrogen can be eliminated by the bowel in this way; and Graham has shown that considerable quantities of ammonium salts are present in the vomit of a uraemic patient. The skin rashes I should also look upon as an attempt to excrete toxins. This leaves us with three groups of symptoms which can be fairly classed as uraemic, but I would urge that these groups are due to different toxic substances and are of different significance.

1. *Convulsions and Amaurosis.*—Though very dramatic symptoms, these are really of less serious significance than the others. Patients may recover not only from the attack, but actually from the nephritis. They may occur also in eclampsia and toxaemic kidney, both conditions from which recovery may be complete. In my series of 160 cases of war nephritis convulsions occurred in 8. They all recovered and escaped without permanent damage to the kidney. It has been suggested that these symptoms are due to some toxin acting on the liver rather than to the kidney lesion. On this view I am in favour of treating such patients with insulin and dextrose, since a hepatic toxaemia is best helped by providing an ample store of glycogen in the liver. But there is no doubt that the best and most rapid relief can be given by prompt venesection. Bennett ingeniously compares the convulsions to tetany, pointing out that there is a reduction of blood calcium in both conditions.

2. *Uraemic Asthma.*—The sufferer from this has been graphically described by Rose Bradford as "a drowsy patient, with hissing respirations and bleeding gums." I believe that the cause of this distressing syndrome is acidaemia from failure of the kidney to excrete acid sodium phosphate. The hydrogen-ion concentration of the blood is consequently raised and the dyspnoea is an attempt at compensation for this by washing out carbon dioxide from the lungs. A compensated alkaline defect may exist without dyspnoea, but an uncompensated alkaline defect will cause dyspnoea and calls for free administration of alkalis. De Wesselow finds that a rise of blood phosphates and a fall in calcium content go together.

3. *Headaches; drowsiness; twitchings; hemiplegia; monoplegia; neuralgias; formication; pruritus.*—All this group of symptoms appear to be associated with nitrogen retention. The actual cause of the symptoms seems to be exudate of lymph and even of actual blood through the capillary wall, especially into the cerebral and the subcutaneous tissues. Small punctiform haemorrhages are commonly seen in necropsies on uraemic patients, and large or small purpuric areas in the skin are not infrequent. Canti considers that a blood urea of 300 mg. is a sure portent of a fatal issue; and I should agree, though I have had one case with a blood urea of 500 mg. reduced to 70 mg. under treatment, and sufficient clinical improvement for the patient to leave hospital. He died, however, about six weeks later. In this case, as there was no dyspnoea, the plan of giving hydrochloric acid was adopted, and the improvement certainly appeared to follow this. It has been suggested that in this way toxic amino-acids are converted into ammonium chloride, but I am not convinced that this is chemically sound. But, as already pointed out, dyspnoea implies an acidaemia calling for free administration of alkalis, under which I have also seen some slight fall in blood urea.

In connexion with nitrogen retention I should like to call attention to the different results given by the hypobromite and urease tests for non-protein nitrogen in the blood. The former method gives the amino-acids as well as the urea, the latter the urea only. Now in health 92 per cent. of the nitrogen given by the hypobromite test comes from the urea, but it must not be assumed that a similar proportion exists in disease. I have, indeed, found the hypobromite test yield twice as much nitrogen as the urease test in uraemia. In other words, in uraemia there is a large increase in the relative and absolute amount of non-protein nitrogen other than urea, and it is presumably this "unknown" amino-acid fraction which is toxic, since urea is a harmless substance. If only one method is going to be used it is better to employ the hypobromite test. But using both gives most useful information as to the amount of toxic material.

This is well illustrated by the great rise of blood urea, sometimes accompanied by tetany, in cases of pyloric obstruction and in toxic conditions severe enough to produce anuria; here the hypobromite and urease methods may give identical figures showing that the rise of blood urea is merely secondary to failure of excretion; there is not, at any rate at first, any excess of amino-acids produced by altered metabolism. Pyloric obstruction presumably acts by preventing ingestion of fluids into the blood stream, so that there is not sufficient for the kidney to function properly. The combined use of the hypobromite and urease methods is a useful way of recognizing such conditions and of proving that they are not primarily renal in origin.

It will be seen that I do not subscribe to the doctrine sometimes advanced that the symptoms of uraemia are due to one specific toxin, albeit of unknown nature. On the contrary, it seems to me that the three different groups of symptoms above detailed are much more likely to be due to different chemical poisons.

Conclusion.

In conclusion, I am conscious that these more recent investigations appear to have had a destructive rather than a constructive effect on treatment. This must be admitted, but new aids to treatment will surely spring from a sounder pathology. In the meantime, our patients will do all the better and be more comfortable if we realize that many of the methods formerly recommended in the treatment of these diseases are impotent where not actually harmful.

FURTHER OBSERVATIONS ON THE MACROPOLYCYTE.

BY

W. E. COOKE, M.D., M.R.C.P.

(From the Pathological Department, Wigan Infirmary.)

THE statement that megakaryocytes are not infrequently found in the peripheral blood continues to be repeated in papers and in textbooks, but while not denying that the megakaryocyte may be found in the blood stream, its presence must be extremely rare. I have never seen, in blood films, a cell which faithfully resembled the multinucleated giant cell of the marrow; nor have I seen photomicrographs or drawings of the cells so described that are at all convincing. There is every probability that the vast majority of the so-called megakaryocytes found in blood films belong to one or other class of macropolycyte.

Definition.

The term "macropolycyte" (1927) is applied as a descriptive title to the large or giant polymorphs found in certain conditions. The normal neutrophil polymorphonuclear leucocyte, for brevity called the polymorph, measures 10 to 12 microns in diameter in fixed and stained films. (Plate I and Plate II, Fig. 1.) The title "macropolycyte" is given to the large cells of the polymorph type having a diameter of more than 14 microns. It is of this cell which this paper treats, but for its better appreciation a few details concerning the polymorph may be recounted.

The Polymorph in Health and in Infections.

The polymorph enters the blood stream from the marrow with a single-lobed nucleus, and as its life in the circulation continues, the nucleus becomes more lobulated until

towards the end of its existence it has four or five segments united by fine strands of chromatin. (Plate I.) In the blood stream, therefore, there are normally cells representing the various periods from youth to senility, and it was found by Arneth (1904) that the numbers of polymorphs with one, two, three, four, or five nuclear segments were remarkably constant in health and could be classified on these lines. My own average *normal count*—that is, the percentage of cells in the various classes corresponding to nuclear segments—is:

Class I	II.	III.	IV.	V.
10	25	47	16	2

This was the average of the counts of 90 normal persons of both sexes between the ages of *12 and 55 years*. The greatest possible care was taken to exclude infection at the time the blood was taken, and for two months previously. The teeth, throat, nose, ears, chest, abdomen, and urine were examined, and in many cases radiograms were taken of the chest and teeth.

The length of life of the polymorph *in the blood stream* has been estimated on experimental and clinical grounds (Ponder, 1926; Cooke and Ponder, 1927) to be approximately three weeks. The figures given above represent a polymorph population comparable to infants, children, men, old men, and senile men, in which the deaths in the older groups are exactly compensated for by the births from the marrow. The figures of the polynuclear count tell us whenever this normal state becomes altered, whether by the addition of an unusually large number of young cells, by the removal of an unusually large number of old cells, by both these conditions combined, or by some interference with the normal development.

It will be noted that no class is provided for cells with more than five nuclear segments. Such polymorphs are so rare in normal blood that when they do occur they are placed in Class V.

*In infective conditions the per*centage of cells of Classes I and II is increased, and the older cells of Classes IV and V rapidly disappear from the circulation. The count has, therefore, a left-handed drift, as in the following example.

	I	II	III.	IV.	V.
Normal	10	25	47	16	2
Typhoid fever	54	31	15	—	—
Scarlet fever	44	43	13	—	—
Measles	45	39	16	—	—
Erysipelas	45	40	14	1	—
Diphtheria	41	39	17	3	—
Rubella	30	35	32	3	—
Varicella	33	35	28	4	—
Pertussis	34	39	27	—	—
Puerperal sepsis	43	37	21	—	—
Cerebro-spinal fever	40	45	14	1	—
Lobar pneumonia	57	26	15	2	—

These facts make the appearance of the macropolycyte the more remarkable, because, although a fairly rare cell, it is found in infections associated with a polymorphic leucocytosis and a left-handed polynuclear count.

THE MACROPOLYCYTE.

On morphological grounds macropolycytes may be divided into two classes. The first, or Type I, macropolycyte resembles the other polymorphs of the blood film in that its nuclear structure and fine oxyphil granules are indistinguishable from those in the polymorph, but differs from that cell by reason of its large size and by the hypersegmentation of its nucleus.

The second, or Type II, macropolycyte may be styled "the megakaryocyte type," because its gnarled nucleus and coarse granules, some of which are azurophil in staining reaction, resemble to some extent those of the bone marrow giant cell. The conditions in which these giant polymorphs are found are:

I. *The Type I Macropolycyte.*—(1) In health. (2) In infections and in other states in which there is bone marrow reaction—for example, the acute pyogenic infections, acute tuberculosis, certain cases of carcinoma, the exanthemata, myeloid leukaemia, malaria,* and in rabbits with experimental anaemias due to ricin and repeated haemorrhages. (3) In Addison's anaemia.

II. The *Type II macropolycyte*, or the megakaryocyte type, is, so far as my own experience extends, found only in cases of Addison's anaemia in grave relapses.

Before proceeding to further discussion of the two types, the moment is opportune to suggest that, although the Type I macropolycyte found in Addison's anaemia may be morphologically identical with its prototype found in health and in intoxications, the cause of its appearance is probably very different. For this reason the Type I macropolycyte

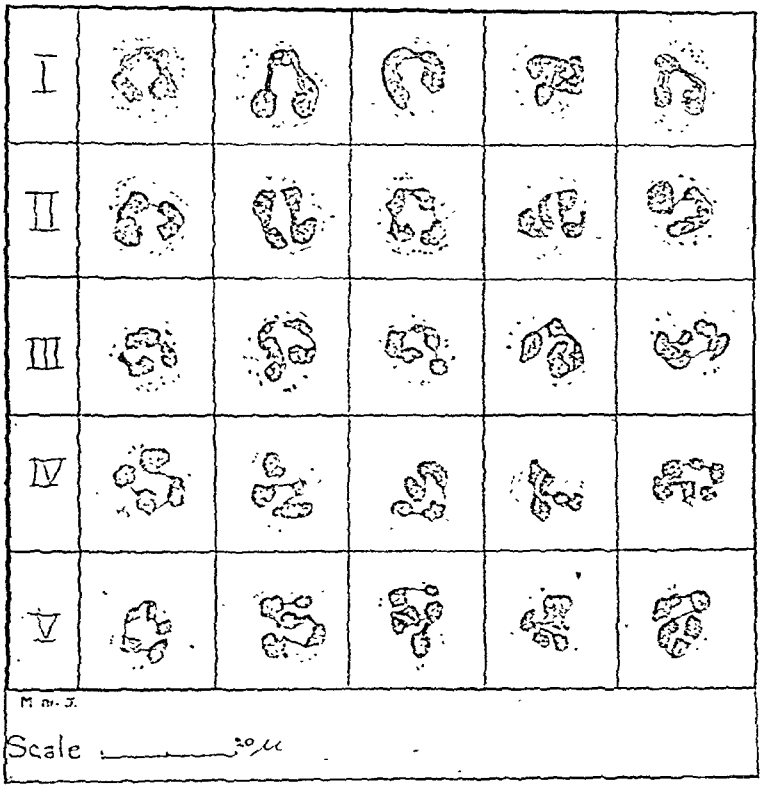

PLATE I.

The five classes of the Arneth or polynuclear count. *If there is any band of nuclear tissue, except a chromatin filament, uniting the nuclear masses, those parts must not be considered as separate segments. Class I, No. 2, Class II, Nos. 3 and 4, Class III, No. 4, and Class IV, No. 5, illustrate this point. In Class V, No. 4, the upper segment of the nucleus overlies the segment below it, but the thin chromatin filament uniting them can be seen on the left.*

* The fact that macropolycytes occurred not infrequently in malaria was pointed out to me by Dr. D. U. Owen, clinical pathologist, Liverpool School of Tropical Medicine.

of health and of intoxications would be better considered together, and both the types found in Addison's anaemia classed under the heading "the macropolycytes of Addison's anaemia."

The Type I Macropolycyte in Health and in Conditions of Abnormal Marrow Activity.

1. *In Health.*—Macropolycytes are extremely rare in health, no example being seen in the blood films of the 90 investigated normal persons that formed the basis of our average normal count. Recently, however, I observed a macropolycyte in a man, aged 34 years, whose polynuclear

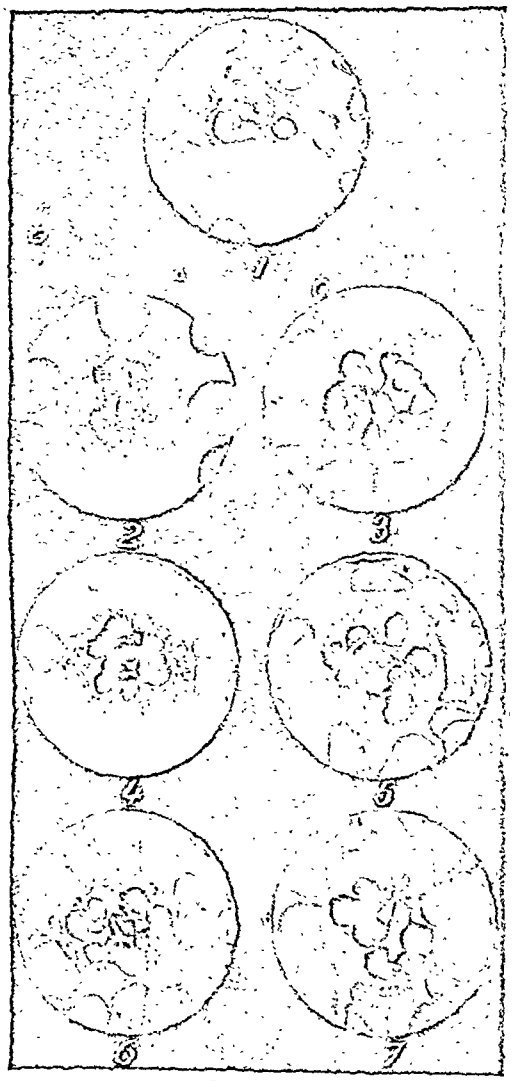

PLATE II.

FIG. 2.—Macropolycyte, Type I, from a case of staphylococcal osteomyelitis. (× 1,000 diameters.)

FIG. 3.—Macropolycyte, Type I, from a case of streptococcal septicaemia. (× 1,000 diameters.)

FIGS. 4 AND 5.—Macropolycytes, Type I, from a case of mixed infection by *Staphylococcus aureus* and *Bacillus coli*. (× 1,000 diameters.)

FIG. 6.—Macropolycyte, Type I, from a case of streptococcal endocarditis. (× 1,000 diameters.)

FIG. 7.—Macropolycyte, Type I, from a case of carcinoma of the breast. (× 1,000 diameters.)

count had previously been included in the original 90. He was reinvestigated, but no focus of infection could be found. The counts of the two occasions were almost identical:

I.	II.	III.	IV.	V.
11	31	42	14	2

The count has a weighted mean of 2.65, which falls close to the average normal mean of 2.74, and within the limits of normality. I think we must accept the fact that macropolycytes do very occasionally appear in normal blood films.

2. *In Conditions of Abnormal Marrow Activity.* This type is illustrated by the Figs. 2 to 7 in Plate II.

Plate II, Fig. 2 is a macropolycyte found in a case of staphylococcal osteomyelitis, which had the following blood count:

Total leucocytes	18,000 per c.mm.
Polymorphs	87 per cent.
Polynuclear count	41; 43; 15; 1; 0.

Plate II, Fig. 3 is a macropolycyte from a case of streptococcal septicaemia.

Total leucocytes	26,000 per c.mm.
Polymorphs	79 per cent.
Polynuclear count	34; 43; 21; 2; 0.

Plate II, Figs. 4 and 5 are macropolycytes from a case of a mixed infection by *Staphylococcus aureus* and *Bacillus coli*.

Total leucocytes	23,700 per c.mm.
Polymorphs	88 per cent.
Polynuclear count	45; 39; 15; 1; 0.

Plate II, Fig. 6 shows a macropolycyte from a case of streptococcal endocarditis.

Total leucocytes	16,000 per c.mm.
Polymorphs	76 per cent.
Polynuclear count	33; 34; 27; 0; 0.

Plate II, Fig. 7 is a macropolycyte from a case of carcinoma of the breast.

Total leucocytes	14,500 per c.mm.
Polymorphs	76 per cent.
Polynuclear count	35; 37; 26; 2; 0.

It will be seen that the macropolycytes have hypersegmented nuclei, although polymorphs with single and bilobed nuclei predominate in the blood films. What is the explanation of their presence? It is not easy nor particularly important to determine why macropolycytes appear in health and in infections, because they are rare and do not seem to have any prognostic or diagnostic significance. There are two possible explanations of their presence. The first, that they may represent an occasional polymorph that has escaped the physiological mechanism whose function is the destruction of aged leucocytes and their removal from the blood stream. A polymorph has been imprisoned in some tissue space, exceeded its allotted span of life, and continued to develop beyond the normal limits. The result is that it has become a giant. The second explanation is that they are cells whose development has been altered by an abnormal medium to which they have been exposed in the marrow during the first period of their development.

The Macropolycytes of Addison's Anaemia.

1. The Type I macropolycyte is frequently found in Addison's anaemia, and here again it is necessary to consider the general behaviour of the polymorph in this disease. As we have seen above, in the infective state the polynuclear count is left-handed. Many uncomplicated cases of Addison's anaemia, however, show the remarkable state of having an increase in the cells of Classes IV and V, and the count appears to be actually right-handed, as the following figures show:

	I.	II.	III.	IV.	V.
Normal ...	10	25	47	16	2
Case 1 ...	8	20	39	22	11
Case 2 ...	6	27	40	22	5
Case 3 ...	7	20	44	24	5
Case 4 ...	7	16	29	39	9
Case 5 ...	20	31	17	16	16
Case 6 ...	16	22	32	16	14
Case 7 ...	10	15	38	24	13
Case 8 ...	12	34	26	20	8
Case 9 ...	6	20	42	20	12
Case 10 ...	8	24	30	26	12
Case 11 ...	6	18	36	24	16
Case 12 ...	6	20	40	26	8
Case 13 ...	14	28	23	20	15
Case 14 ...	12	28	36	18	6

This condition is not seen in any microbic disease, and is very strong evidence against Addison's anaemia being due to an infection.

It has been pointed out above that no class is made in the polynuclear count for cells with more than five lobes in their nuclei, because cells with more than five lobes are rare in normal blood, and if any are found they are placed in Class V. In Addison's anaemia, on the contrary, hypersegmentation of the nucleus in cells of normal size is frequent. The nucleus may have six, seven, eight, or even ten or more divisions. Plate III, Figs. 1 to 11 are examples of this nuclear hypersegmentation in cells of approximately normal diameter. All gradations in size are seen until the macropolycyte is reached. Plate III,

PLATE III.

FIGS. 1 TO 11.—Polymorphs showing hypersegmentation of the nucleus from cases of Addison's anæmia. (× 1,000 diameters.)

FIGS. 12 TO 16.—Macropolycytes of Type I found in Addison's anæmia. (× 1,000 diameters.)

The photomicrographs illustrating this article are by C. F. Hill and W. E. Cooke. Plate I is reproduced from *Blutuntersuchung Haematologie* by kind permission of Messrs. Charles Griffin and Co. Plates II, III, and IV are reproduced by kind permission of Dr. Paul Chevallier, editor of *Le Sang*.

PLATE IV

Macropolycytes of the megakaryocyte type (Type II) found in cases of Addison's anæmia. (× 1,000 diameters.)

Figs. 12 to 16 are examples of the Type I macropolycyte. Its frequency in Addison's anaemia contrasts very sharply with the rarity in health and in infective conditions, and the cause of its appearance is not the same.

There are several possible causative factors. Polymorphs of normal size with hypersegmented nuclei accompany the Type I macropolycyte in this disease, and the first thoughts are that there is some biochemical change in the plasma that prematurely ages the polymorph and alters its life-history; the second, that the mechanism for the elimination of old polymorphs is in abeyance. The third reasonable thesis may be advanced that the polymorph is inherently abnormal owing to a defect in its parent, the haemocytoblast, or in its environment. Possibly, too, there is a single biochemical defect that is responsible for all three conditions. The liver diet alters the polymorph picture in a few days. Macropolycytes and polymorphs with hypersegmented nuclei disappear, and at the same time the morphologically and probably also chemically abnormal cells of the haemoglobiniferous series are replaced by cells of normal appearance.

2. The Type II or megakaryocyte type of macropolycyte *is found only in Addison's anaemia,* and appears in blood films during serious relapses. Almost all the cases in which it has been found have had erythrocyte counts of less than 1,000,000 per c.mm., and before the era of liver treatment all died within a short time of its appearance. After death these large cells are found, as Gulland and Goodall (1925) pointed out, in the liver in association with islets of megaloblasts and in the pre-aortic lymph glands. Plate IV illustrates the variations in this type of cell. The cells are large, measuring up to 24 or more microns in diameter, and resemble the megakaryocyte of the marrow. The nucleus is gnarled and may be of the simple horseshoe type, or may have fourteen or more segments. The coarse cytoplasmic granules are not all oxyphil, but mixed with varying numbers of azurophil granules.

The cell does not resemble any embryonic or post-natal blood stream cell, nor is it an accurate replica of the megakaryocyte of the marrow. The life-history would appear similar to that of the polymorph in that it commences its circulatory existence with a single-lobed nucleus, which later becomes segmented. Its length of life we do not know, nor have we any means of calculating it. There is considerable doubt about its origin. It may be an expression of the abnormal reversion to embryonic type of the marrow haemocytoblast as are the haemoglobiniferous cells in Addison's anaemia. On the other hand, *the cell may not arise in the marrow but originate* in the mesenchyme descendants in the liver and haemolymph glands that have undergone abnormal myeloid metaplasia.

Conclusions.

1. The macropolycyte found in health and in infections has no diagnostic nor prognostic significance, and is due to the accidental prolongation of the lifetime of a neutrophil polymorphonuclear leucocyte.

2. The causation of the appearance of the Type I macropolycyte in Addison's anaemia is closely related with the factors responsible for the production of hypersegmentation in the nuclei of the polymorph. Whether the factor *is a biochemical change in the environment or an inherent* defect in its parent cell is not known.

3. The Type II or megakaryocyte type of macropolycyte may have its origin in the marrow, or arise from the endothelium of the liver and haemolymph glands. In the first case it is the product of abnormal reversion of the haemopoietic tissue, and in the second of abnormal myeloid metaplasia.

CANCER AND THE GENERAL PRACTITIONER.*

BY

CECIL ROWNTREE, F.R.C.S.,

SURGEON TO THE CANCER HOSPITAL, LONDON.

MANY of the papers on the subject of cancer might lead the casual reader to imagine that early diagnosis of this condition is never effected except by the writers of the papers in question, and that practitioners as a body fail *signally in their duty to the community. It is often for*gotten that the early diagnosis of a case of cancer demands the co-operation of an intelligent and alert patient, ready to seek immediate advice, with a doctor competent to appreciate minor departures from the normal and ready to give immediate advice. The patient, however, may be unobservant; or he may not bother, until it is far too late, about a condition which seems to him—usually because it is not painful—of little or no importance. Conversely, the doctor sometimes lets the patient down by making avoidable mistakes.

Generally, I think, mistakes arise from one of two causes: The first is imperfect examination, which may be the fault of the patient or the doctor. The patient, for various reasons, may refuse to be thoroughly examined, or the doctor may continue to prescribe for his patient without attempting any real examination. He may, for instance, give treatment for "piles" without examining the rectum, or give medicine for abdominal pain without inspecting the abdomen. The other fruitful source of error is want of thought—failure to attain, by a careful summing-up of symptoms, the clear perspective which would lead to an immediate diagnosis.

Unfortunately there is no royal road to a diagnosis of cancer—no short cut, as there is in the case of syphilis. But we have many valuable aids to diagnosis, both bedside and laboratory. In the former category are such instruments as the proctoscope, the sigmoidoscope, and the cystoscope, which are used far too rarely by practitioners, though in many cases they are easy to use, easy to maintain, and most invaluable in the information they give.

In the latter category are tests for occult blood in the stools, or for free acid in the stomach. But it is most important to remember that these are only aids; they must never be considered apart from their context—the patient. We must guard ourselves against the danger of getting lost in a laboratory maze; above all, we must not attach undue importance to negative findings, especially to those of the x-ray examination. One often finds that both patient and doctor are lulled into a feeling of security by a radiologist's report that there is nothing abnormal to be seen, which is wrongly taken to mean that nothing abnormal is present.

The subject of early diagnosis embraces a consideration of the preventive treatment of cancer by the early detection and prompt treatment of conditions that we know to be precancerous. I still often see patients with warts of the lip and tongue, papillomas of the bladder, small rodent ulcers of the face, or small tumours of the breast, who have been told that they need not bother about them unless they become troublesome. By the time such things become troublesome they are troublesome indeed.

Periodical Medical Examination.

I will refer briefly to the controversial topic of periodical medical examinations, although why it should be controversial I cannot imagine. We all go to the dentist at regular intervals; we are all examined for life insurance from time to time; some of us have our drains inspected periodically; others have their electric wiring tested. It does not seem to me unreasonable, therefore, to carry this established principle to its logical conclusion and to undergo periodical medical inspection. I should like also to see much more intelligent and sustained instruction of our youth in the elements of physiology, for there can be no question that a more perfect knowledge on the part of the public of normal physiology would result in a quicker appreciation of any departure from the normal standard, and greater readiness to seek advice. At present people know far more of the anatomy and physiology of

* Notes of a lecture given at Leeds under the auspices of the Yorkshire Council of the British Empire Campaign.

their cars than of their own bodies. They know whether or not the car is missing, or heating up, or knocking, and that such defects require immediate investigation and treatment; but to similar premonitory symptoms in their own bodies they attach no importance, and often fail to undergo an overhaul until complete breakdown has developed.

It is still believed by most surgeons that cancer is a strictly local disease in its early stages, and that if the growth can be completely removed or destroyed a good permanent result will be achieved. What are the local methods of treatment at our disposal? They are only two —operative removal and radium; and it is the anxious and by no means easy task of the practitioner to make or influence a final decision when the alternatives have been put before the patient.

RADIUM THERAPY.

The therapeutic action of radium and its mode of use depend upon the fact that it emits two kinds of rays which produce effects upon the cells and tissues of the body—*beta rays*, which are caustic and indiscriminate in their action equally affecting every kind of tissue, and *gamma rays* which are selective in their action, and affect cancer cells more easily than the normal tissues.

The caustic, indiscriminate, and, incidentally, the very superficial action of beta rays renders them unsuitable for therapeutic purposes; and as they are unable to pass through a thin sheet of platinum it is quite easy to cut them off entirely by enclosing the radium in a shell of platinum 0.5 mm. thick. The more powerful and selective gamma rays easily penetrate this amount of platinum, and as it is only these rays that we make use of, it is gamma-ray therapy that we really mean when we speak of radium therapy.

A fundamental feature of the gamma ray is its short radius of effective action; it is therefore necessary to place the radium in intimate contact with the part it is proposed to treat, and so has come about the use of the buried radium needle. Radium needles are hollow, provided with an eye, and vary in length and thickness according to the purpose for which they are to be used and the amount of radium it is proposed to put inside them. Suitably filled, they are threaded with silk or similar material, and embedded in and around the growth, which undergoes destruction, leaving the normal tissues unaffected. But this does not happen all at once, and we know now that there is an important time factor in radium treatment, the effects produced by a large quantity of radium acting for a short time being quite different from those produced by a relatively small quantity acting for a long time. The explanation would appear to be that in the main the gamma ray exercises its selective action upon cancer cells in the act of division. Not all the cells of a growth are undergoing this change at the same time; one cell may divide to-day and be destroyed in the process, while its next-door neighbour, which may not be due to divide for three or four days, will escape injury if the radium is not still in position. There has thus come about the gradual development of a technique involving the use of buried needles each containing no more than two or three milligrams of radium, but remaining in the tissues for a week or so at a time.

There is another important practical point in treatment that results from the selective action of radium upon the dividing—that is, the growing—cell. The main mass of a new growth is composed largely of adult cells which have lived their life, and will, in any event, ultimately die a more or less harmless death. It is at the growing edge of cancer that all the actively dividing cells are situated, and it is therefore the periphery, and not the centre, that matters. If we can control the periphery, the centre will often look after itself. Surround the growing edge with a barrage of radium needles and the whole growth melts away. There are, furthermore, wide variations in the reaction exhibited by different kinds of cancer, but we are beginning to recognize and understand them, and by examination of the tissue are able to form some sort of estimate as to its probable reaction to treatment.

Radium therapy has, however, very definite limitations, chiefly arising from the fact that the action of radium is strictly local. We are all sometimes pressed to give radium treatment in cases with metastases when we know full well that the course of the disease cannot be influenced in any degree whatever. It is our duty to do what we can for our patients, not only physically, but mentally; but we also owe a duty to our own reputation, to our profession, and to the development of radium therapy. It would be the greatest disaster to the cause of radium surgery if the results following upon its reckless and uninstructed use were allowed to obscure the good results obtained in properly selected cases.

Cancer of the Cervix.

Radium scored its first regular and consistent successes in the treatment of cancer of the uterine cervix. At the Cancer Hospital many patients who have come into hospital on an ambulance—weak, emaciated, septic, and bleeding—with a growth of the cervix long past the stage of operation, have been enabled, after treatment by radium alone, to walk home, well and strong. The results of irradiation in cancer of the cervix are, in my judgement, such that radium can now compete on equal terms with surgery in the treatment of early and operable cases of this disease, and I believe that it is perfectly fair and proper to offer patients the choice of operative or radium treatment. Operation, even in the ablest hands, carries a fair mortality, and always involves removal of the ovaries and most of the vagina, but gives a good prospect of permanent freedom. Radium treatment, on the other hand, carries practically no mortality, involves no injury to ovaries or vagina, and gives a prospect of permanent freedom not quite so good perhaps as operation, but at any rate so good that the actual figures over a five-year period afford material for legitimate controversy between the protagonists of the two methods.

Cancer of the Buccal Cavity.

About the next site I want to consider there is no controversy at all. It is the tongue, and buccal cavity generally, and here, with epithelium which closely resembles that of the cervix uteri, the results are similar. All surgeons will agree that operations for cancer of the tongue are about the most disappointing they are called upon to perform. It is true that we have all had occasional successes, but my own were so few and far between that I came to dread the admission of these cases to my wards. You will understand, therefore, with what interest we watched the work of Regaud in Paris and Evans and Cade in this country, and how gladly we relinquished operative surgery and whole-heartedly adopted the radium needle technique for the treatment of these depressing cases. We have a long way to go yet, and much to learn, particularly in dealing with the secondary glands, but we have certainly reached a point where it may be said that the treatment of choice for cancer of the tongue, floor of mouth, cheeks, pillars of fauces, tonsil, pharynx, and larynx is radium.

Cancer of the Breast.

The radium treatment of breast cancer is still in the experimental stage. The operative treatment of early cancer of the breast gives excellent results, for the mortality is negligible, the mutilation is not important, and the ultimate results are good. What can radium offer in similar cases? The immediate results in many cases are apparently as good as those obtained by surgery; the primary growth shrivels up, the glands disappear, and, of course, the breast is not sacrificed. But we do not know yet how long this will last; the systematic treatment of early breast cancer by radium has not been practised long enough to enable us to form a clear opinion as to whether the primary growth or glands return, or whether distant metastases are more or less likely than after surgical operation. My own practice, therefore, is to operate upon early and suitable cases, but to use radium when the patients are old and feeble, when there is any intercurrent disease, or when —owing to extensive glandular involvement—there appears to be no good prospect of obtaining permanent cure by operation.

Cancer of the Rectum.

I think the position with regard to the rectum is very similar to that of the breast. I have seen a few very good results from radium treatment—that is to say, destruction of the growth without the disadvantage of a permanent colostomy. But these cases are so few in number, and the results of surgery in early cases are so good, that I still think it our duty to recommend surgical removal in suitable early cases, reserving radium for the more advanced cases, for the old and feeble, and for the very young; for I know of no case of cancer of the rectum under 30 years of age where operation has had any permanent success.

These examples exhaust the common kinds of cancer in which radium has had a real test, but it has been tried, and is being tried, in many other situations. Cancer of the stomach, cancer of the colon, and cancer of the head of the pancreas are examples that suggest themselves as suitable, and I have embedded radium in all these situations. The numbers are too few, however, and the time too short, to form any definite conclusion about results.

THE RESPONSIBILITY OF THE SURGEON.

Cases of this latter class lead to a consideration of the question as to who is to decide when radium should be applied, and who is to apply it. There is no possible doubt as to the answer; it must be the surgeon; for who else is competent to perform an exploratory laparotomy, to diagnose the nature, and estimate the extent and connexions of the growth, and embed radium needles suitably and effectively in such a way that they will do their work and then permit of safe withdrawal? In the past in this country radium has been chiefly entrusted to the care of roentgenologists, who from the very nature of their training and daily avocation have few opportunities of acquiring extended clinical experience or of familiarizing themselves with surgical technique. But now that the position of radium has been established in surgery many hospital authorities have put their stock of radium in charge of the surgical departments.

In my view this is the right procedure, and surgeons who wish to keep in touch with modern developments must learn the principles and practice of radium therapy in exactly the same way as they would learn the use of a new instrument or any other new method of treatment of proved value. There is no need even to discuss the suggestion that a new class of specialist should be evolved – primarily a physicist—who must learn enough surgery to enable him to devise means of approach to growths in the less accessible situations. The "surgery of access" is everyday surgery, and the view that the use of radium should be confined to a special class is just as unreasonable as the suggestion that the use of potassium iodide should be confined to pharmacologists.

TREATMENT OF ADVANCED CASES.

In discussing the treatment of advanced cases of cancer – cases which, for various reasons, do not lend themselves to radical operation or to radium treatment—I would first refer to the role of palliative operations—operations, that is to say, which merely aim at increasing *comfort* and prolonging life. There is a whole range of such operations – gastrostomy, jejunostomy, colostomy, and cystostomy—all most valuable in their way, but all carrying grave drawbacks in their train, chief of which is the fact that they must be performed upon patients already doomed to die of their disease, and so have come to be associated in people's minds with a *hopeless* outlook. I find that this pessimism is not confined to the general public, but that practitioners as a whole share the common opinion, and, indeed, often add the weight of their influence in dissuading their patients from undergoing them.

I find it easy to understand this, for no one practitioner sees very many cases of the kind, and it is difficult enough for him to form a just estimate when he daily sees his case going steadily downhill. He is inclined to forget how much unhappier the patient would be without it, and how much, on the average, such an operation does towards prolonging life and increasing comfort. One only sees the value of these operations in perspective when they are done for non-malignant conditions. For example, a gastrostomy done for simple stricture of the oesophagus is fully compatible with an active busy life. Similarly, jejunostomy performed for the treatment of chronic simple ulcers of the stomach too extensive for removal is an operation which has given brilliant results—so good, in fact, that I have lately tried the experiment of treating the smaller ulcers of the stomach by jejunostomy in preference to partial gastrectomy. I invariably perform it in all cases of cancer of the stomach too advanced for excision or for gastro-enterostomy. Pain is at once relieved, vomiting ceases, and nutrition is easily maintained by four-hourly feeds through the jejunostomy tube.

What other means are at our disposal for helping the later stages of cancer, and delaying its almost inevitable termination? I am afraid we must reluctantly admit that there is nothing at present which is likely to prove a universal cancer cure. We are therefore reduced to treating symptoms, and I would like to refer to a few points which are brought home to us by our experience in the incurable wards of the Cancer Hospital.

Unquestionably our most important duty is to relieve pain, and to this end there is nothing that takes the place of morphine. Very large doses will often be necessary, but it is worth remembering that cocaine and hyoscine are useful variants in cases where morphine has distressing after-effects, or is ineffective. Many painful conditions are much relieved by exposure to *x* rays. There is no doubt a psychic element as well, but our patients at the Cancer Hospital certainly get great help and comfort from their periodical visits to the *x*-ray department.

Surgical opportunities of dealing with severe pain are few and far between, but when they come the results may be dramatic. For instance, the division of the lingual nerve in cancer of the tongue, or, better still, the destruction of the third division of the trigeminal nerve by alcohol injection, gives immediate relief. Bolder measures involving such major surgical procedures as the division of the posterior spinal roots, or even a portion of the cord itself, have a smaller application than might be expected owing to the poor general condition of the patient by the time that they are indicated. The aspiration of fluid from the pleura or the abdomen is an obvious method of giving help, but I am not sure that it is generally done soon enough or repeated often enough.

Attempts to control discharge from sloughing surfaces afford scope for ingenuity in the use of antiseptics, but the value of any antiseptic is greatly increased if it can be applied in the form of a power-driven spray. The mouth sprays used by dentists and operated by compressed air are most useful for this purpose and thoroughly cleanse every crack and crevice on a sloughing surface. I should like to see compressed air laid on at every bed in a cancer ward. If discharge is largely derived from excessive mucus secretion, the value of belladonna should be remembered. It gives special help in pharyngeal cases where the presence of much frothy mucus is such a troublesome feature.

The question of deodorants must also claim attention, for however careful we may be in maintaining adequate ventilation, something of the kind is often necessary. In my experience the most valuable has proved to be essential oil of peppermint, which should be sprinkled on the dressings or the blankets. It is true that it only hides one unpleasant smell by a more powerful one, but at least it is recognized and understood, whereas the undisguised smell of advanced uterine or rectal cancer, of which happily the patient is often quite unconscious, brings the greatest misery and suffering to the relatives and friends.

In thinking of symptoms and their relief we must not forget the patient. Sunshine, real or artificial, and fresh air, are of just as much importance in cancer as in other wasting diseases, and I look forward to the time when such hospitals as my own will have branches in the country where the incurable cases may spend their last remaining months of life on sunny balconies in the open air, rather than in the confined wards of a London hospital.

EXTRAUTERINE GESTATION AT TERM WITH HEALTHY BABY.

BY

A. M. RICHARDS, M.B., B.S.Lond., M.R.C.P.,

HOUSE-SURGEON TO THE OBSTETRIC UNIT, UNIVERSITY COLLEGE HOSPITAL.

All cases of extrauterine gestation late in pregnancy are sufficiently rare and interesting to be worth recording in some detail, but the following case has several features that are probably unique.

E. M., a married woman, aged 25, first attended the ante-natal department of University College Hospital on July 3rd, 1923, being pregnant for the first time. Apart from scarlet fever and a vague history of "gastric trouble" she had always been very healthy. Her periods had been quite regular during her married life until February. On February 10th a period began which lasted four days, after which she saw nothing.

During the first three months of the pregnancy she suffered from morning sickness, and during the last few days of June she complained of attacks of colicky pain around the umbilicus, lasting for three or four minutes. Sometimes she vomited during these attacks and at other times not at all. There was no vaginal bleeding then or, indeed, at any time during her pregnancy.

She was examined for the first time on July 5th. Her general condition was good, and her heart and lungs normal. The height of the fundus was noted as twenty-six weeks, although she was only twenty weeks and five days pregnant according to her dates. The presenting part was above the brim, but the presentation could not be determined. The foetal heart sounds were not heard, although foetal movements had been noticed by the patient. The pelvic measurements were normal, and the urine contained no sugar or albumin.

She next attended on August 16th, when the presentation was found to be a right sacro-anterior. On October 11th she again complained of attacks of pain of one month's duration, which were becoming more frequent. There was no vomiting, but she was compelled to lie down during the attacks. She was unable to pass water during the attacks, and also complained of frequency and pain on micturition. On examination the height of the fundus corresponded to thirty-five weeks' pregnancy, the presentation was still a breech, her temperature 98.6° F., blood pressure 156/96 mm. of mercury, and urine quite normal. On this date the foetal heart sounds were heard for the first time at the fundus uteri. Nothing abnormal was noted on abdominal examination, and she was given a palliative for her symptoms.

On October 18th the presentation was transverse, and on the 27th she was admitted as an in-patient. On the 29th she was examined under anaesthesia. The foetal parts were not excessively easy to define even under the anaesthetic. The foetus lay in the left cephalic dorso-posterior position. After attempting external version the head lay above the pelvic brim slightly to the right, but could not be pushed down into the pelvic cavity although it did not appear to be unduly large. On internal examination no pelvic contraction could be discovered, the external os was closed, and the cervix not taken up. Two theories were invoked to explain the failure to complete the external version: (1) extension of the legs of the foetus; (2) a short umbilical cord caught round the neck or the body of the foetus. At the end of the manipulation the foetal head lay in the right iliac fossa, and the foetal heart rate had risen from 110 to 160 per minute.

On the next day the head again lay on the left side, and an *x*-ray examination was made. The film confirmed the presentation, and showed that the foetal legs were flexed and the bones normal in every way. The patient was discharged with instructions to come up immediately if labour began, and in any case to come into hospital two days before the expected date of delivery (November 17th). She was readmitted on November 15th with the foetus still lying transversely. Two lines of treatment were considered: (1) internal version during labour; (2) Caesarean section. The latter was finally decided on as the patient was anxious to have a living child, and the risk to herself was probably not greater than that of internal version and breech extraction. Her general condition was still that of a normal healthy pregnant woman.

On November 20th an operation was performed by Professor F. J. Browne, under general anaesthesia (chloroform followed by ether), administered by Dr. H. N. Webber. A right lower para-median incision 8 in. long was made, and the abdomen opened. At once several abnormalities were noted. In the first place, the left round ligament lay almost in the mid-line at the pelvic brim (suggesting torsion of the uterus); secondly, the "uterus," which was pale yellowish in colour, had two dark venous sinuses low down on its anterior surface lying subperitoneally. An incision was made between them, and to our surprise liquor amnii began to escape before the scalpel had sunk to any appreciable depth. In enlarging the incision a slight nick was made in the lower edge of the placenta, and from this free haemorrhage occurred. The foetus was then delivered, and the cord, which was wound once around the trunk, separated. Meanwhile the house-surgeon had endeavoured to turn the uterus out of the abdomen, but it was noticed that he only held placenta and membranes in his hand. On further examination the uterus was found lying above the pelvic brim, and pushed far over to the right side, while the placenta was attached to the left cornu of the uterus and the left broad ligament. There were no adhesions to the hollow viscera, so that removal of the placenta presented no great difficulty. The infundibulo-pelvic and broad ligaments and the cornu of the uterus were clamped, and the placenta and membranes, with the left tube and ovary and the greater part of the left broad ligament, removed. (The right tube and ovary appeared quite normal.) Owing to the softness and vascularity of the parts ordinary pedicle ligatures cut through and failed to control the haemorrhage, which was fairly free. This was controlled by digital pressure until interrupted mattress sutures of catgut could be inserted. These effectively controlled the bleeding, and all that then remained was to cover over the raw area with peritoneum, using that of the anterior and posterior layers of the broad ligament.

The patient left the theatre in fair condition, with a pulse rate of 130 per minute, and on returning to the ward she was given rectal salines, and, later, morphine 1/4 grain with atropine 1/120 grain. She quickly rallied from the haemorrhage, and was able to suckle her baby after the third day. The temperature was normal throughout the puerperium. On the tenth day the stitches were removed, and on the twenty-first the patient left hospital. No lochia were seen at any time.

The baby was a full-time female child, well formed, and weighing 6 lb. 6 oz. at birth. After dropping to 5 lb. 11 oz. on the fourth day it gained weight steadily, and left hospital weighing 6 lb. 10 oz. It was fed at the breast every three hours during the day.

The Specimen.

The specimen removed at operation was found to consist of a sac, placenta, ovary, tube, and part of the left round ligament. The sac wall contained three layers—amnion, chorion, and peritoneum. The placenta was divided into several separate areas with membrane between, and the insertion of the cord was velamentous about one inch from the lower margin of the placenta. The maternal surface was rough, where it had been detached from the uterus and the base of the left broad ligament, but a considerable part of it was smooth on both sides, due to the attachment of the placenta to the posterior layer of the broad ligament, which had been removed with it, and therefore remained *in situ*. The left tube and ovary lay below and in front of the sac, and the inner end of the tube was extremely stretched, so that it at first appeared to end three inches from the left cornu of the uterus. This, however, was only apparent, the isthmus being stretched over the sac wall and placenta so as to be indistinguishable from them. The left ovary contained a corpus luteum. It was concluded that this was a case of secondary ligamentary pregnancy, which had grown at the expense of the posterior layer of the broad ligament.

Comment.

Several features in this case are worthy of note as being unusual in cases of extrauterine gestation:

1. Neither the symptoms nor the signs during pregnancy were sufficiently pronounced to suggest the diagnosis of extrauterine gestation. In most recorded cases an extrauterine gestation lasting till term has produced a severe or fatal illness, whereas in this case the patient was comparatively well throughout the pregnancy.

2. The diagnosis was not made until the operation was in progress.

3. This case probably provides a unique reason for the failure of external version. It is, indeed, remarkable that the sac was not ruptured by the attempt.

4. Contrary to the usual findings in such cases the child was not deformed.

5. The unusually favourable site of the placenta no doubt accounts for the happy result to mother and child.

When last seen, on March 15th of this year, the mother and baby were both doing well, and the baby weighed 13 lb.

A similar case was reported by Dr. Fairbairn in the *Proceedings of the Royal Society of Medicine*, vol. xii, April, 1919, p. 183; and another by Mr. Jessop in the *Obstetric Transactions* for 1875.

I am much indebted to Professor Browne for his help and for his permission to publish this case.

THE RADIOSCOPICAL DIAGNOSIS OF FILARIASIS.

BY

J. B. CHRISTOPHERSON, C.B.E., M.D., F.R.C.P.,

PHYSICIAN FOR TROPICAL DISEASES AT THE FREEMASONS' HOSPITAL, LONDON; PHYSICIAN TO THE CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, VICTORIA PARK, LONDON.

HOSPITALS in tropical countries are not as a rule provided with *x*-ray apparatus, and consequently medical practitioners in the tropics have not often the advantage of investigating cases by this simple and reliable method of diagnosis; radioscopy cannot be introduced where electrical plant is not installed. This field of medicine has, however, not been neglected when opportunity admitted. Ample evidence of progress in this respect was afforded recently in London by demonstrations of the diagnosis of tropical bowel ailments, and in Egypt by the notable work of G. O. Lotsy, Mahmoud Affifi, J. E. Bateman, and others, who have so strikingly brought the later complications of bilharziasis within the region of exact diagnosis by the *x* rays.

One form of filariasis may be considerably illuminated by the *x* rays—the filariasis due to the invasion of the trematode worm *F. bancrofti*, which in its adult and larval stages infests the human lymphatics, and is a widespread infection of many tropical countries, being transmitted by the three genera of mosquitos—culex, aedes or stegomyia, and anopheles.

The disease, though not indigenous, is by no means unknown in England; its late manifestation, elephantiasis, appearing after a person has left the tropics. In its earlier stages filariasis (*F. bancrofti*) may be a silent disease giving rise to no symptoms, only diagnosable by blood examination (eosinophilia and the presence of larvae).

Elephantiasis may not show itself for an undefined number of years after the initial infection with the parasite; it is not, of course, a silent phase of the disease, but mild and early cases are not easy to diagnose with certainty because, the adult parasites being dead, the larvae have disappeared from the blood, and eosinophilia is not always present. A patient may present himself with a limb or appendage somewhat bigger than its fellow, which on examination exhibits a little solid oedema, perhaps conspicuous superficial veins, but, objectively, little more. If it be the lower limb, as it frequently is, the patient may experience a sensation of tenseness and numbness after walking—a feeling that it does not belong to the owner; such symptoms are not peculiar to elephantiasis. No doubt this condition will be suspected if there is a history of residence in the tropics. If, however, the blood examination is negative the diagnosis is a matter of opinion. Well-marked cases with characteristic signs due to much lymphatic obstruction following oft-repeated infections are easily diagnosed without the assistance of radioscopy; they are seldom seen in England, but in mild cases, where the parent worms are dead, calcified, and encysted, *x* rays may be a valuable help to diagnosis. The case which I am recording is one in point.

A missionary, aged 62, had spent thirty-four years in South Africa in a parish of 649 square miles, situated between Durban and East London on the east coast, with the Indian Ocean on the east and the Drakensberg range on the west—the Transkei native settlement. During the first fourteen years he spent one night at one place and the next night at another, and so on, month by month; he was frequently bitten by bugs and mosquitos in the huts which he tenanted. It is worthy of record that he had never suffered from malaria or dysentery; in fact, he never had a day's illness during his thirty-four years in Africa. For the last eighteen years he was more or less stationary at Tsolo, Kaffraria.

Diagnosis in his case was important, for he had for some time been looking after a leper, and he himself suspected that he had leprosy. The usual examination of faeces and blood were made, with negative results; there was a trifling eosinophilia (5 and 9 per cent.), but the nocturnal and diurnal blood contained no larvae. The urine was normal, as was the heart; in fact, the only pathological condition present was some calcareous degeneration in the arteries shown well in the anterior tibial artery in one of the films which were taken. The left leg was quite normal; the right was a little larger, the calf by 1½ inches and the thigh by 2 inches. Beyond the sensation of increased weight and the feeling that the leg did not belong to him—sensations experienced after walking—there were no subjective symptoms. Except for some conspicuous veins the skin was natural in appearance; the tactile and other afferent sensations were normal. He recently had no difficulty in walking fifteen to twenty miles a day in Switzerland.

Comment.

I have seen an *x*-ray film from South Africa presenting a somewhat similar cystic condition, though the cysts were much more numerous and appeared to be distributed to all the skeletal muscles of the body, including the face muscles. The cysts were much the same shape as in my case. This film was that of a native infested with the *Cysticercus cellulosae*. The individual cysts appeared to be larger than those of *F. bancrofti*, and there is no reason for thinking that the present case was a case of *Cysticercus cellulosae*. I hoped to have been able to reproduce the photographs of the case and the *x*-ray films, but this was not practicable.

The right leg is slightly larger than the left. Small oblong cyst-like objects occur in the thigh and calf, though only scantily, one in the thigh and one (perhaps two) in the calf; they may well be occupying lymphatic vessels. They appear to taper towards one end; on the films the shadows seem to be about half an inch long, the thick end appears to be of a lighter shadow than the tapering end. I had the leg *x*-rayed in two or three positions, and the objects were always there, altered, of course, in position according to posture.

I examined radiologically other parts of the body—the pelvis, abdomen, chest, and neck—but I could find no filaria worms occupying the lymphatics elsewhere; no doubt others were present, but they were not calcified and therefore did not show in the films.

The cysts which are visible appear to be about half an inch long, to be thicker at one end, tapering to the other; the broad round end appears to be of a lighter shadow on the film.

DIFFERENTIAL DIAGNOSIS OF SPUTUM IN CHRONIC LUNG INFECTIONS.

BY

P. JANVRIN MARETT, M.R.C.S., L.R.C.P.,

LIEUTENANT-COLONEL R.A.M.C.(RET.),

MEDICAL OFFICER OF HEALTH AND BACTERIOLOGIST, STATES OF JERSEY.

THE differential diagnosis of a sputum demands not only its direct microscopical examination, but the preparation and examination of cultures. With respect to the former, when tubercle bacilli are found they may be classified into long, short, or minute forms, and further note may be made of whether or not the organisms are granular, and of the occurrence or otherwise of clumping. The most chronic clinical type of tuberculosis appears to be associated with the presence of long granular bacilli showing clumping; the most acute type with minute, non-granular, and scattered bacilli. At the same microscopical examination the presence of "other organisms" should be noted. These are commonly *B. influenzae*, pneumococci, streptococci, and staphylococci.

Whenever "other organisms" occur a cultural examination has shown them to be invariably associated with yeast-like fungus forms. It follows that as the simplest culture medium for the growth of fungi is beer wort, samples of all sputa should be put up for culture on this medium. The vast majority of fungi thus cultivated belong to the group of fungi imperfecti, and are chiefly monilias. In approximately 85 per cent. of cases monilias are found alone; in the remaining 15 per cent. they are found associated with other fungi. Castellani's pathogenic forms are frequently isolated.

The literature on the subject of monilia infection of the lungs is accumulating, but, unfortunately, moniliasis is usually referred to as a tropical disease. As a result, however, of the above routine examination of sputa one is forced to the conclusion that a large percentage of patients suffering from tuberculosis of lung are suffering also from moniliasis, and that in cases in which fungi are not present the patient is usually not so much a sufferer as a carrier of tubercle. The following is a classification of the results of 2,373 systematic differential examinations of the sputa from 304 patients during 1928: of the 304 patients, 62 were

negative both to tubercle and to fungus infection: of the remaining 242 patients, 6.61 per cent. were infected with tubercle bacillus only, 27.27 per cent. with mixed tubercle bacilli and blastomycetes, and 65.11 per cent. with blastomycetes only.

What may be the significance of the presence of these blastomycetes? They are always to be found in sputa containing "other organisms," and whether considered as pathogenic or non-pathogenic they certainly appear to be activators of growth, not only of "other organisms," but also of the tubercle bacillus. Treatment with vaccines and with alkaline potassium iodide causes the disappearance of the fungus and the diminution, at times a total disappearance, of the tubercle bacillus. Potassium iodide is recognized as the drug of choice in the treatment of fungus infections, and it may be noted that the tubercle bacillus is classed as a fungus belonging to the family Mycobacteriaceae. In Jersey differential diagnosis and differential treatment of tuberculous infections have been associated with the striking fall in the total death rate from all forms of tuberculosis which followed the institution of the bacteriological laboratory in 1922. The reduction in these deaths in the years during which differential methods have been employed is shown in the accompanying table.

Year.	Tuberculosis Deaths.	Year.	Tuberculosis Deaths.
1922	86	1926	53
1923	63	1927	55
1924	65	1928	47
1925	49		

Conclusion.

It is considered that the fall in deaths from tuberculosis has been due to the foundation of a laboratory, which has allowed of differential diagnosis and consequently of differential treatment.

TREATMENT OF SEPTIC HANDS AND FEET ON SHIPBOARD.

BY

R. A. NEWSOM, M.R.C.S., L.R.C.P.,

NEW BARNET, HERTS.

WHILE acting as a temporary ship surgeon on a cruise extending over a period of five months, I recently had occasion to treat a series of septic hands and feet among some of the crew. Owing to lack of facilities, instruments, and drugs, I was forced to employ methods differing considerably from those to which I was accustomed. But the apparent success was such that publication of some of these facts might be helpful to someone similarly situated, or might interest someone in a better position than myself to carry on further investigation.

Most of the cases occurred in the tropics, which have a bad reputation for prolonged healing in septic cases. The commonest condition was septic hands among firemen, probably caused by blistering or burning of the skin of the palm, dirt, grease, and infection being then well ingrained into the wound.

Routine Treatment of Abscesses.

The general routine treatment was to open up the abscess with an incision at least one to one and a half inches in length, make no attempt to prevent bleeding, which at times was quite brisk, and then plunge the septic limb into a hot iodine bath (1 drachm of tinctura iodi mitis to a pint of hot water). A gauze dressing soaked in hydrogen peroxide was then applied (hydrogen peroxide, besides being an anti-septic, is a very useful haemostatic), and a bandage was tied well above the wound. Thus for a septic hand the arm would be bandaged above the elbow, just tight enough to cause venous congestion, and left in position for twenty-four to forty-eight hours. The patient was instructed to return the next day, or later in the same day, if the infection appeared acute, when the dressing would be *soaked off* in another iodine bath and a dressing of glycerin and magnesium sulphate (equal parts) on lint or gauze would be applied.

Glycerin and magnesium sulphate dressings would be repeated three times a day for the first two days, each dressing being soaked off in a hot iodine bath, and then twice a day until the wound appeared clean and no pus was apparent, when a dry dressing of iodoform powder on lint was employed. In every case, having once made an incision large enough to allow the pus to escape, the wound was touched as little as possible. No attempt was made to express pus by squeezing, but the patients were encouraged to move the affected limbs themselves whilst they were soaking them in the bath.

The advantages of this method are: (1) The apparatus is simple, all that is required being a basin, a bottle of tinctura iodi mitis, some hot water, a bottle of glycerin and magnesium sulphate, and some gauze or lint. (2) It is comparatively painless. (3) It eliminates the necessity for hot fomentations, which are difficult to apply effectively and only transitory in their action.

Choice of an Anaesthetic.

Out of a total of fifteen cases (three Europeans and twelve Chinese) I operated on four by freezing with ethyl chloride local anaesthesia. The disadvantages of freezing are that it undoubtedly causes intense pain during the thawing process, and its anaesthetic effect is so transitory that the operator has time only for a quick stab with the knife. In three cases no anaesthetic of any sort was employed, and apart from the momentary pain of the incision, the patients appeared to experience less pain in the aggregate than those who had been subjected to ethyl chloride anaesthesia.

I also endeavoured with the last eight patients to ascertain whether nerve blocking with 2 per cent. novocain would have any effect as an anaesthetic, or whether injecting the fluid into a septic limb would have any deleterious effect on the septic condition. I found, as the following case records show, that the injection of novocain appeared to have no markedly bad effect in delaying healing but that as an anaesthetic it gave variable results.

Case 1.—A Chinese fireman with a temperature of 100° F., pulse 100, and a history of pain in the palm of the hand for three days. There was considerable swelling of the palm and some swelling on the dorsum of the hand, the greatest point of tenderness being situated between the fourth and fifth metacarpal bones in the palm. The patient was unable to flex his fingers himself, and the movement of flexion caused considerable pain. Around the ulnar nerve, just behind the internal epicondyle of the humerus, 3 c.cm. of 2 per cent. sterile novocain were injected, and after an interval of ten minutes a vertical incision 1½ inches in length was made over the part where there was most fluctuation. Pus was obtained. The patient appeared to feel a certain amount of pain, but less than with freezing.

After-treatment with iodine baths and magnesium sulphate and glycerin dressings was adopted, the wound healed well, and the patient returned to duty in the stokehold on the eighth day.

Case 2.—A Chinese fireman, with cellulitis of foot, temperature 101° F., pulse 100. The whole of the dorsum of the foot was red and swollen, the ankle was oedematous and its contours were eliminated. Around the external popliteal nerve, just internal to the tendon of the biceps femoris in the popliteal space, 3 c.cm. of 2 per cent. novocain were injected, and after fifteen minutes a 2-inch incision was made on the dorsum of the foot. No pain was experienced from the incision and a serous discharge was obtained. The patient was treated by the method previously outlined. The temperature remained up to 100° for four days, but after that the wound healed well. All the swelling subsided by the eighth day, and he returned to work, attending for daily dressings until the tenth day, when the wound was healed.

Case 3.—A European steward with a subungual paronychia of five days' duration on the ring finger of the right hand. Temperature and pulse were normal. Around the digital nerves 2 c.cm. of 2 per cent. novocain were injected, giving complete anaesthesia at the end of ten minutes. The whole of the nail was removed and two vertical cuts were made, one on each side of the nail bed. A hydrogen peroxide gauze wick was inserted under the flap. The wound was treated with iodine baths and glycerin and magnesium sulphate dressings. The patient was irregular in his attendances, and was never off duty, sometimes washing plates with his bad hand, in spite of this the wound healed in twenty days.

Case 4.—A Chinese fireman with septic third digit of the right foot; the toe was swollen to nearly the size of the big toe. Around the external popliteal nerve 2 per cent. novocain was injected, and after twenty minutes the patient volunteered the statement, through the interpreter, "that his foot felt quite all right, and he would like to return to work." An incision 1½ inches long was made on the dorsum of the toe; no pain was experienced during the incision; the wound was treated as described above and the patient returned to work in eight days.

Cases 5 and 6.—Both of these patients had septic fingers with swelling most pronounced over the terminal phalanx. In each case incision was made under blocking of the digital nerves at both sides of the base of the proximal phalanx; no pain was experienced. Treatment was as before, and the patients returned to work respectively four and six days afterwards.

Case 7.—Septic palm of hand, more pronounced on the ulnar side, with considerable swelling on the palmar surface and slight oedema on the dorsum of the hand. Incision was made under blocking of the ulnar nerve, and caused slight pain. The wound was treated in the usual way, and the patient returned to work in nine days.

Case 8.—Septic hand, oedema of the back of hand and swelling of palm, most pronounced between the heads of the second and third metacarpal bones. The ulnar nerve was blocked behind the internal epicondyle of the humerus, and 2 c.cm. of 2 per cent. novocain were injected under the palmaris longus tendon, two inches proximal to the first transverse crease of the wrist, in an endeavour to block the median nerve. The incision gave no pain, the wound was treated in the usual way, and the patient returned to work in seven days.

General Conclusions.

With the exception of the one steward, who took twenty days before the wound healed, and one trimmer whose finger, originally opened under ethyl chloride anaesthesia, had to be reopened, and who took twelve days before returning to duty, no man was away from his work for more than nine days, most of them for less. I believe that Cases 1 and 7 experienced some pain at the moment of the incision because I failed to realize that the median and ulnar nerves intercommunicate in their nerve distribution to the palm of the hand. In Case 8, when I blocked both the median and ulnar nerves no pain was experienced from the incision. Although gas must remain the anaesthetic of choice for cases of septic hands or feet, for a doctor who is unable to obtain an anaesthetist, or for a patient who refuses a general anaesthetic, nerve blocking with novocain should prove a satisfactory substitute.

Directly pus has formed in any situation in the hand or foot it should be given an opportunity to escape by a free incision, and the operation should be undertaken deliberately and with no attempt at hurrying. If one operates under freezing, or without an anaesthetic, there is a tendency to hurry and perhaps an insufficient incision is made. If early and deliberate incisions are made, allowing free drainage, there is less likelihood of a whitlow progressing and becoming a suppurative teno-synovitis of the forearm, or causing an osteomyelitis of the phalanges or metacarpal bones.

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

HAEMOPERITONEUM DUE TO SPONTANEOUS RUPTURE OF THE SPLENIC VEIN.

CASES of haemoperitoneum of unknown origin are not infrequently recorded in the literature. The following case, therefore, seems to merit publication, since such a condition was traceable to spontaneous rupture of the splenic vein associated with cirrhosis of the liver.

A woman, aged 38, was admitted to the Leeds General Infirmary at 10 a.m. on December 8th, 1928, having been seized with lower abdominal pain six hours earlier. She was extremely pale and restless; the pulse was 120, and the temperature 96° F. The respiration was slow and gasping; she was fully conscious. The abdomen was distended, and there was dullness to percussion in both flanks, but no evidence was obtained of uterine bleeding. A diagnosis of haemoperitoneum was made, the source of the haemorrhage being uncertain in view of the absence of amenorrhoea or any significant previous history. Immediate laparotomy was decided on, but unfortunately the patient died before this could be undertaken.

A post-mortem examination was made on December 10th. The abdomen was found to be full of blood, which was partly clotted, and had obviously come from the left upper abdomen. The liver was small (weight 25 oz.), and presented a grossly nodular surface. The spleen was considerably enlarged (weight 15 oz.); it was free from adhesions, and there was a single scar at the lower pole. On section it presented a normal appearance. The lesser sac contained a good deal of blood. The splenic vein was found to be enlarged, tortuous, and considerably thickened, having a mean diameter of about three-quarters of an inch. About half-way along its course there was a tiny rupture, approximately a six-tenth of an inch in diameter, which was the source of the peritoneal haemorrhage.

The liver showed a well-marked multilobular cirrhosis; there was little evidence of active destruction of liver tissue, but the fibrosis was unusually dense. The splenic pulp was increased. There was no evidence of syphilis in this case, nor was there any striking varicosity of the oesophageal or haemorrhoidal veins. The lenticular nuclei were normal.

The woman, a servant, had enjoyed apparent good health till three weeks before her death; during this period she had complained of indigestion. Her employer had noted an increasing mental dullness during the past year. It is of interest to note that several bottles of gin had been missed by her employer, and a bottle of brandy was found among the woman's possessions, but beyond this there was no definite history of alcoholism.

This complication of cirrhosis of the liver must be extremely rare, though peritoneal haemorrhages are recognized as a complication of cirrhosis by Osler[1] and others. Osler[2] mentions rupture of varicose veins as a cause of haemoperitoneum, and, quoting Ernst and Gammeltoft,[3] states that trauma is an important factor. We could discover no history of trauma in this case. An apparently similar case has been recorded by Ogilvie.[4]

We wish to thank Dr. G. L. Neil for supplying the details of the patient's previous history, and Professor Carlton Oldfield for permission to publish this case.

APPENDICITIS CAUSED BY BILHARZIA.

IN the records of bilharzia lesions I have been unable to find any instance of appendicitis caused by this parasite. I venture, therefore, to bring forward details of such a case.

The patient, a male aged 24 years, a native of Tanta in the Nile Delta, came to this country in 1926 for educational purposes. He had had typical vesical bilharziasis in 1920. He then received the greater part of a course of injections (presumably of tartar emetic), but discontinued the course when the symptoms subsided. Although there was no recurrence he underwent a complete course of injections in 1925, before coming to this country, and was told that he could consider himself cured. He had never shown any signs of involvement of the intestinal tract.

He remained well until December, 1927, when he had an attack of abdominal pain with a rise in temperature (100° F.). The tenderness was not localized to any part of the abdomen. He was very constipated. Enemata relieved the condition at once. The temperature subsided and the abdominal symptoms disappeared. The spleen was not enlarged.

In March, 1928, he had a similar attack, though more severe. There was slight rigidity of the right rectus muscle, and the site of maximum tenderness was at McBurney's point. He was again very constipated, and when this was relieved by enemata all the symptoms subsided. The question of removing his appendix was discussed, but the operation was not performed.

On June 12th, 1928, a third and still more severe attack commenced. He had acute abdominal pain, at first round the umbilicus, but soon settling down in the right iliac fossa. There was rigidity of the right rectus muscle. The abdomen was distended. He vomited twice. In spite of previous warnings he was again very constipated. When enemata had been administered the acute symptoms subsided, but some tenderness and slight rigidity over the appendix persisted. Mr. T. Carwardine was called in, and it was decided to remove the appendix. The operation was performed on June 27th. The appendix was bright red and still showed signs of acute inflammation. Several small white nodules, similar to tubercles, were noticed on the serous aspect. Professor Walker Hall kindly examined the organ microscopically and reported that the appendicular wall showed areas of fibrosis and contained many ova of *Schistosoma haematobium*. Some of the older ova were calcified. Round the groups of ova were signs of acute inflammation, the tissues being infiltrated with small round cells and the blood vessels engorged. There was not any evidence of pyogenic organisms, or of tubercle or actinomycosis. The only apparent cause for the acute inflammatory attack was the ova of the parasite. The ova were seen passing through the mucosa, as well as blocking the lymph canals of the submucosa. Some had penetrated the muscular layer and occasioned the formation of round, fibrous, and calcified nodules just under the peritoneal surface. Examination of the urine and faeces showed no ova. The faeces contained a small quantity of blood and excess of mucus. The blood count showed a marked eosinophilia—12 per cent. of the total white count.

It follows from the fact that many of the ova seen in the sections are fresh that the patient is still harbouring active

adult trematodes, which are presumably localized in the appendix area. Serial sections did not reveal the presence of adult forms, although there was a cavity with appearances of parasitic origin.

The patient made an uninterrupted recovery from the operation.

In *Archives of Pathology, vol. 5*, and again in the number for May, 1928, A. Plant has articles on this subject. He records a case of bilharziasis in an apparently normal appendix which gave no symptoms. He points out that though the spines appeared in sections to be terminal, it was found that they were lateral when the tissues were dissolved out with potassium hydroxide.

I am indebted to Mr. Carwardine for the surgical treatment and advice, and to Professor Walker Hall for the pathological work and advice.

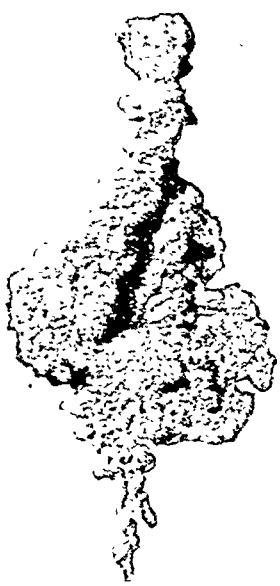
Clifton, Bristol.

ABDOMINAL TORSION OF THE OMENTUM.

In view of the rarity of this condition the following case seems worthy of publication.

A married woman, aged 32, was admitted to hospital complaining of abdominal pain of two days' duration. Her temperature was 100° F., pulse-rate 104, respirations 20. Mastitis had followed a confinement three years previously, and the patient had become much stouter during the four or five years prior to admission.

While stooping at her washtub one morning the patient became conscious of a dull aching pain in the lower part of the abdomen on the right side; the pain was less severe when she stood up. She continued her work until 4 p.m., notwithstanding an increase in the severity of the pain. A restless night followed. Domestic remedies, such as hot poultices, only relieved the pain very slightly. The pain continued during the next day, when she was seen by her medical attendant and sent to hospital.



On examination the patient was found to be very obese. The pain, which was continuous and located in the right iliac fossa, was of a dull, aching character, with exacerbation on movement. There was loss of appetite, but no vomiting. The bowels were opened on the day of admission. The tongue was clean and moist. Tenderness was elicited to the right of the umbilicus, and there was rigidity of the right rectus abdominis muscle below it; no mass was palpable. Nothing abnormal was detected elsewhere, and a provisional diagnosis was made of subacute appendicitis.

That evening a right paramedial incision was made below the umbilicus, and the rectus muscle was retracted laterally. When the peritoneum was picked up and incised a small quantity of blood-stained fluid welled up through the incision. No mass was found in the appendix region, and the appendix showed no signs of inflammatory process. On passing the hand upward, to examine the gall-bladder a firm mass was encountered, lightly adherent to the anterior abdominal wall below and to the right of the umbilicus. The mass was easily freed and pulled down into the wound, when the nature of the condition became apparent. The mass consisted of a portion of very congested omentum dependent, by a narrow pedicle, which was twisted twice in a clockwise direction. There was no bowel in the mass. The pedicle was transfixed, tied, and divided; appendicectomy was then performed. Further exploration failed to reveal the presence of a hernial opening, or of any pathological condition in the pelvis.

The subsequent progress of the patient was uneventful.

The etiology of this condition is the subject of controversy. Bayer and Baraz[1] state that there are usually found two points of support around which the omentum can revolve to produce the strangulation. This theory is supported by the frequent association of torsion of the omentum and the inflammatory changes in the appendix.

The specimen removed in the present case shows a long fine projection of omental tissue at the base of the strangulated mass. At the time of operation this band was not observed to be adherent, but such an adhesion, if present, might easily have been broken through in the manipulations to deliver the appendix and caecum.

[1] Quoted by Wiener, *Annals of Surgery*, 1900, 2, p. 648.

The case reported illustrates the common findings in this condition as summarized by Cowell.[1] Attention might be drawn to the facts that (1) the pain was first felt in the right lower abdomen, and not around the umbilicus as in appendicitis; (2) there was no nausea and vomiting, and the anxious facies associated with acute disease of the intestinal tract was absent.

I am indebted to Mr. Kenneth Fraser for permission to publish this case.

ARCHIBALD RONALD, M.D.,
House-Surgeon, Royal Albert Edward Infirmary, Wigan.

Reports of Societies.

STERILIZATION OF THE MENTALLY UNFIT.

At a meeting of the Medico-Legal Society on April 25th, with SIR WILLIAM WILLCOX in the chair, a paper was read by Lord RIDDELL on the sterilization of the unfit.

Lord Riddell quoted from the report of the Board of Control the numbers of notified insane persons and mental defectives, and from the recent report of the Mental Deficiency Committee[2] the estimate that the total number of defectives of all ages is 300,000, and that institutional accommodation is required for 64,000, as well as residential special schools for 23,000 feeble-minded children. He quoted also from official documents some histories of mental defectives, showing how to parents, one or both of whom were feeble-minded, had been born four, five, or six children, all of them imbecile or of a low grade of mentality. He recited particulars of seventeen cases in the courts during the last two years in which mentally deficient persons had been charged with serious crime. Lord Riddell then took up the statement of the Board of Control that the marriage of defectives had disastrous consequences to the community, and that the time had come when legislative steps should be taken to prevent such unions. While this was obvious, Lord Riddell thought that the fact was overlooked that people of this class did not pay much attention to the sanctions either of Church or Law. The sexual instinct was very powerful amongst mental deficients, who were also extraordinarily persistent and clever in eluding observation, and reproduced their kind far more rapidly than the mentally sound. The Board relied on segregation as a curative, protective, and palliative measure, and trounced the local authorities for neglecting to supply institutional accommodation. What about the cost of such a policy? Lord Riddell entered upon some calculations to show that the additional institutional accommodation called for by the Mental Deficiency Committee would involve a capital expenditure of 29 millions, and that the annual expenditure, representing the cost of maintenance of these feeble-minded persons, including those for whom provision is already made, as well as the notified insane, worked out at 16 millions. Could the community afford to spend so much on a section of the population obviously of the worst type. "Unless we are careful, we shall be eaten out of house and home by lunatics and mental deficients."

The alternative seemed to him to be sterilization, though he admitted that this would not be a complete solution, nor do away with the necessity for a certain amount of segregation. It would, however, effectively prevent the defectives from reproducing their kind, as they were doing at present at the rate of some 2,500 a year. The Board of Control considered that sterilization would not materially diminish the immediate need for increased institutional accommodation; defectives would still require supervision. The Board, said Lord Riddell, was entitled to sympathy. Evidently it did not want to "bell the cat." It perceived the dangers, but was afraid to cope with them. The truth was that the existing system was incoherent and illogical. On the one hand, the Board was demanding more and more institutions; on the other, its

[1] *Brit. Journ. Surg.*, 1925, xii, p. 738.
[2] *British Medical Journal*, April 27th, p. 775.

policy was to return as many lunatics and mental defectives as possible to the outside world. Year by year, with the best intentions, it provided opportunities for lunatics and defectives to breed more lunatics, defectives, and criminals. But sterilization would enable the Board to carry out its policy of parole, discharge, and licence with more freedom and with greater safety to the community. The Royal Commission on the Feeble-minded in 1908 made no recommendation, one way or the other, as to sterilization, which was not surprising; but during the intervening twenty years much more information had been forthcoming. It was now universally admitted that mental defectives tended to breed mental defectives, and it had been proved that segregation was no safeguard against procreation. Moreover, sterilization methods since then had been revolutionized. Vasectomy and salpingectomy were not mentioned by the witnesses appearing before the Royal Commission, the methods suggested at that time being equivalent to castration. Again, economic forces, conditions of modern life, and the birth control campaign had changed the public view with regard to the procreation of children. Lord Riddell said that the measures now proposed were very moderate. Sterilization was to be with the consent to the person concerned, or, if he was under age or incapable of consent, with the consent of his parents or guardians. As the law stood, the sterilization operation was only permissible when performed for some adequate therapeutic reason, and though some might argue that lunacy or mental deficiency was a sufficient therapeutic reason, the authorities who controlled asylums and mental institutions were not likely to take the risk.

To the arguments against interference with individual freedom Lord Riddell replied that not only was the operation to be performed with consent, but that instead of restricting the liberty of lunatics about to be discharged or released on parole, it would increase such liberty by enabling them to assume marital relations without fear of producing undesirable offspring. In any case, individual liberty was constantly being restricted for the safety of the community—witness compulsory vaccination and compulsory segregation in infectious disease. It was argued that sterilization would lead to promiscuity and the spread of venereal disease, but it was not proposed to turn the sterilized lunatics and defectives loose on the community; they would still be subject to a measure of supervision. It was also said that sterilizing operations were dangerous, but in fact vasectomy, which was the usual method for men, was simple and called only for a local anaesthetic. Salpingectomy, the usual method for women, was a major operation, and, like any abdominal section, involved a certain amount of risk. Lord Riddell, however, quoted some figures from California, where sterilization had been in vogue since 1909, nearly 6,000 operations—3,232 on men and 2,588 on women—having been performed. Among these there had been only three deaths, two of them said to have been due to the administration of the anaesthetic. Vasectomy and salpingectomy did not deprive the patient of sexual functions, and it was proved that there was very little change in the sexual inclinations; the procedure only prevented the procreation of offspring. All that was asked was that, subject to proper consents, mental deficients, for their own benefit and that of the community, should undergo an operation which many intelligent people were anxious—as the speaker thought, illegally and improperly—to undergo as a birth control measure. One of the Swiss cantons last year passed a statute prescribing compulsory sterilization for persons whose offspring were likely to be tainted with incurable mental malady. Similar legislation had been passed in Alberta, and sterilization had been recommended by official committees to the Swedish and New Zealand Parliaments. The result of these experiments would be awaited with interest. Lunacy and mental deficiency must always be festering sores, but the time had come when the whole subject required careful consideration and statesmanlike attention.

Following the paper there was a somewhat sporadic discussion in which Lord Riddell's proposals found a considerable body of support, though the objections to sterilization were also put forward.

TREATMENT OF GLYCOSURIA.

A MEETING of the Section of Medicine of the Royal Society of Medicine was held on April 23rd, with Dr. A. F. HURST in the chair. Dr. O. LEYTON read a communication on the question "How are we to decide whether a case of glycosuria is one that should be treated?"

Dr. Leyton said that long before there was any reliable method of estimating the sugar in the blood some physicians had recognized that there were cases of glycosuria in which the sign might be neglected. Later, Saloman contributed an explanation by discovering that some persons had a low renal threshold for dextrose, and excreted that substance in the urine without having a concentration of sugar in the blood above the normal average. Most of those who possessed this peculiarity passed urine containing a low percentage of sugar, usually under 2 per cent. The speaker's experience confirmed the statement of MacLean—that a certain number of patients developed a brief hyperglycaemia after taking dextrose by the mouth, the concentration of sugar in the blood rising sufficiently to lead to a temporary glycosuria in those whose renal threshold for sugar was not below the average. In these cases the fall of the sugar concentration in the blood was rapid and complete within ninety minutes. The object of Dr. Leyton's communication was to draw attention to a condition which at first sight suggested that it was a glycosuria calling for treatment, since it was a hyperglycaemic glycosuria. It was a condition which everyone must have expected to exist, but so far as he knew attention had not been drawn to it. The elaboration of more delicate methods of determining the sugar in the urine had necessitated a new definition of glycosuria. For some years the speaker had attempted to determine the rate at which individuals burnt and/or stored carbohydrate in the following manner:

> The patient is kept fasting for about fifteen hours—that is to say, he has a breakfast consisting of a cup of tea without milk or sugar, having had nothing to eat since the previous evening. He is then given 60 grams of dextrose dissolved in 250 c.cm. of water, to which a little lemon juice has been added. The sugar in the blood is estimated before he takes this, and then samples of blood are taken at intervals of half an hour; immediately after the taking of the samples of the blood the bladder is emptied. This is continued for three hours. After estimating the concentration of sugar in the blood one is able to decide how long it has taken for the sugar in the blood to drop to what it was before the administration of the dextrose or to the level of 0.12 per cent., whichever is the quicker. The urine secreted during this period is next measured, and the amount of sugar and of urea in it is estimated. The object of estimating the urea is to determine how much protein has been destroyed and the quantity of carbohydrate that has been liberated by its destruction. By multiplying the weight of the urea excreted by the factor 1.7 the weight of sugar is arrived at.

The average young healthy person was able to burn and/or store about 50 grams per hour, but it was not safe to assume that if an individual was able to burn and/or store only 25 grams per hour he was therefore suffering from a disease. Dr. Leyton described cases to prove his point that the power of burning and storing sugar varied in different healthy persons, and that it was only the gradual diminution in this power which called for treatment, provided that there were no symptoms present in the cases not treated; also that in doubtful cases the only method of deciding whether that power was diminishing was that of allowing the patient to throw normal work upon the carbohydrate metabolism for a period, and re-examining and comparing results. If there was a definite diminution in the power of metabolizing sugar, then, and then only, was the case one of glycosuria that needed treatment. Dr. Leyton explained how these observations had borne fruit in his own practice. The main object of his communication was not simply to release a certain number of individuals from a restricted diet, but to correct what he called a "refraction" in the outlook upon the treatment of hyperglycaemic glycosuria. When a physician had several of these cases under treatment, and by restriction of their diet found them to continue to enjoy almost as good health as if they were allowed to eat and drink whatever they liked, he attributed their well-being to his skilful dieting, and was inclined to think that other cases which did not

belong to this class should do equally as well. Owing to this, many slight cases of disease were not treated with insulin until the damage to the pancreas had become irreparable.

Dr. E. P. POULTON suggested that one criterion might be taken for the classification of these cases—namely, that the patient might be put upon increasing quantities of carbohydrate and tested at each increase. For example, let 30 grams be given in the first instance, and the sugar output determined, then 60 grams, and again the sugar output, and so on; if the increase in the sugar output was out of all proportion to the amount given, it would create a strong suspicion that the patient had true diabetes.

Dr. R. D. LAWRENCE had always been struck by the number of cases in medical literature which seemed to give at least mild diabetic curves, while yet the disease did not seem to make progress, although no dieting had been maintained. But he thought it was hardly justifiable to draw conclusions from these cases with regard to the general run of blood sugar curves.

Dr. SAXBY WILLIS thought that in some cases instanced by Dr. Leyton an abnormality of the pituitary gland might be the cause of the hyperglycaemia—that is to say, they might be pituitary in origin, not pancreatic.

Bovine Tubercle Bacilli in Pulmonary Tuberculosis.

Dr. W. T. MUNRO read a paper based on work at the Fife and Kinross (Glenlomond) Sanatorium, on the occurrence of tubercle bacilli of the bovine type in pulmonary tuberculosis and the part played by this type in pathogenesis. Dr. Munro said that the recovery of bovine type tubercle bacillus from the sputum was sufficiently rare to command attention. Observations at Glenlomond during the past seven years had led to the discovery of ten cases of patients coughing up the bovine type of tubercle bacillus. Four of these patients with pulmonary tuberculosis of the bovine type showed root-spread disease; one of them had died, two were now free from infection, and the other, a more recent case, was making good progress. Of the total of ten patients, six were alive, four of them free from infection. The most notable features present in all these cases were the amount of the fibrotic changes, the lack of evidence of large breaking down of lung tissue, and the entire absence of haemoptysis. There seemed to be more chance of these patients overcoming their systemic disturbance than was to be found in the similar group of human type infections. Why were bacilli of the bovine type so rarely found in the sputum? He thought it a reasonable argument that the bovine type was not capable of such a general lymphatic spread as the human type in the human subject. Various facts combined to suggest that the bovine type was not capable of generalization or of producing visceral tuberculosis to the same extent. Superinfection with the bovine type leading to chronic ulcerative pulmonary tuberculosis was unlikely unless the superinfecting dose was very large; or, in other words, the allergy occasioned by the previous benign infection could protect against superinfection by the bovine type, but broke down in the presence of the human type of bacillus. He raised the further question whether the disease could have been contracted from an aerogenous infection in any of these cases, and gave reasons for the view that it was most unlikely that the superinfection was air-borne. Whatever the common route of the infection might be, there was little doubt that in most of these cases the route was through the tonsils and cervical glands. His final question was: Could the superinfection producing pulmonary disease have been other than endogenous in origin? He had never been able to find a bovine type in the gland and a human type in the lung, and the evidence on the face of it in these bovine type cases was that the superinfection must be endogenous.

Dr. F. G. CHANDLER said that Koch's hasty dictum regarding the harmlessness of the bovine bacillus had probably impeded preventive medicine. He had often wondered why, if bovine tuberculosis of the lungs in the human being occurred at all, it did not occur more often; one was almost tempted into believing that transmutation of type might occur by long sojourn in the human body, which would be a heresy, against which there was abundant evidence. He believed that air-borne infection was probably the most common mode: and this raised another interesting aspect of the case—namely, that when once a human being was afflicted with a bovine pulmonary tuberculosis, the occurrence of air-borne infection to others became a possibility. Dr. Chandler also commented on the fact that, according to all investigations, a larger proportion of cases of bovine tuberculosis were reported from Scotland than from England, and he wondered whether in the northern country the cows were more subject to the disease.

Dr. MUNRO, in reply to this last point, said that there was not more bovine tuberculosis in Scotland than in England, but the Scottish authorities had been more zealous in searching it out.

CONGENITAL ANOMALIES OF THE URETER.

AT a pathological meeting of the Liverpool Medical Institution on April 11th Mr. C. ALEXANDER WELLS read a paper on congenital anomalies of the ureter. After referring briefly to the embryology, Mr. Wells described a series of observed cases in which he had prepared diagrams of the cystoscopic appearances and lantern slides from radiograms. These cases included five examples of reduplication of the ureter on one side, and Mr. Wells pointed out the importance of recognizing the occurrence of this abnormality, and of instituting adequate investigation in order to avoid mistakes in diagnosis—such, for instance, as passing an opaque catheter up a healthy ureter, some distance away from the doubtful stone shadow, when a second instrument passed along the second ureter on the same side would demonstrate its true nature. Mr. Wells described briefly the morbid anatomy of the kidney in these cases, and, after passing rapidly over congenital cystic kidney, simple and crossed dystopia, and unilateral absence of the kidney, dealt with the subjects of congenital dilatation of the ureter and ureterocele. He showed cystoscopic and radiological findings in the case of a boy, aged 3, with enormous dilatation of both ureters and of their pelves and calyces, without any demonstrable obstructive lesion—in fact, widely patent ureteric orifices on both sides, conforming to the recognized though rare type. He further submitted two adult cases which, he said, were representative of the segmental congenital dilatation of certain authors, and described, in connexion with these cases, a reflux of the bladder content up the ureters, synchronous with respiratory movements and indicated by the excursions of a flake of mucus. He suggested that this sign was characteristic of a more or less dilated ureter associated with a fixed patent orifice, and added that he had noticed it also in tuberculous infection of the ureter. The paper concluded with the recording of two cases of ureterocele or ureteric balloon. In the discussion which followed Mr. FRANK JEANS spoke on the pitfalls associated with congenital absence or misplacements of one kidney. Dr. NORMAN B. CAPON referred to two cases of congenital dilatation of the bladder and ureters described by him, in association with Dr. Fordyce, some years ago. Mr. KENNON doubted the congenital nature of the segmental dilatations. Dr. J. T. MORRISON mentioned the difficulties of diagnosis due to disease complications of these anatomical variations, and described a case of calculus occurring in a ureterocele.

AT a meeting of the Royal Society, on May 2nd, a paper on the loss of water and salts through the skin and the corresponding physiological adjustments was communicated by Dr. J. S. HALDANE and Messrs. W. HANCOCK and A. G. R. WHITEHOUSE. Sir FREDERICK ANDREWES presented a paper by Drs. R. G. CANTI and F. G. SPEAR, on the effect of gamma irradiation on cell division in tissue culture. Dr. H. H. DALE communicated a paper on the absorption spectrum of vitamin D, on behalf of Dr. R. B. BOURDILLON and Messrs. C. FISCHMANN, C. JENKINS, and T. A. WEBSTER.

Reviews.

MANSON'S TROPICAL DISEASES.

THE issue of a new edition of *Manson's Tropical Diseases*[1] is always an event of importance in the field of tropical medicine, for the book is read by students and practitioners in all parts of the world, and the number of medical men who rely upon it in the course of their practice in the tropics must be very great. During the five years which have elapsed since the eighth edition appeared there have been many changes and developments in tropical medicine, particularly with reference to diagnosis and treatment. A perusal of the ninth edition will convince the reader that the editor, Dr. PHILIP MANSON-BAHR, is well fitted to carry on Manson's great work. He has kept himself informed of all developments, while his experimental enterprise has led him to test and judge for himself any new methods of treatment and diagnosis. His extensive experience enables him to write with authority, and this forms one of the most valuable features of the book, which provides the reader with a clear, accurate, and up-to-date account of the present position of tropical medicine.

The ninth edition differs little in size from its predecessor, though much new matter has been introduced apart from the thirty new text figures and five half-tone and four coloured plates. This has been rendered possible by much rewriting and abridgement, and the judicious use of small type for certain sections. The book is of convenient size, well printed, and carefully selected subjects are beautifully illustrated. The general arrangement and classification are the same as in the previous editions, though certain changes have occurred. Thus, the recent work on yellow fever, largely the outcome of the discovery that the disease can be transmitted to the monkey *Macacus rhesus*, has necessitated its separation from the leptospiral infections such as Weil's disease and seven-day fever. The facts that the virus is a filterable one and not a leptospira, and that there is a possibility of protection by vaccination, are duly noted. Noguchi's work on Oroya fever and verruga peruana and his cultivation of the causative agent *Bartonella bacilliformis* is described, as also the allied organism *Bartonella muris*, which appears in the blood of rats after splenectomy. Mention is made of Kingsbury's researches on haemolysis in malaria and their bearing on the etiology of blackwater fever. The important work on the relationship of sand-flies to kala-azar which has been carried out in India and China has required the revision of the section on the etiology of this disease. Under treatment many new remedies and methods are described. The recently introduced plasmoquine for malaria, and Sinton's alkaline quinine method of treatment, are discussed. Good results are reported from transfusion in intractable cases of sprue, while Scott's calcium lactate and parathyroid method is also mentioned. In connexion with kala-azar the developments in organic antimony therapy are duly noted, while the advances in the chemotherapy of amoebic dysentery, leprosy, yaws, and other diseases are fully dealt with. In all cases precise details for carrying out treatment are given, so that practitioners will have no difficulty in following the instructions given. In many other sections there have been changes and additions. Thus, the general methods of malarial prophylaxis are more fully dealt with, and in this connexion mention is made of the value of Paris green, while James's method of infecting mosquitos with malaria is illustrated and described. The improvements which have taken place in the diagnosis of helminthic infections by the complement-fixation test are duly noted, while recent work on the influence of vitamins in beri-beri and other deficiency diseases has not been overlooked.

The above are merely a few of the many changes which recent advances and discoveries have necessitated in this new edition, but they illustrate the thoroughness with which the editor has done his work. The appendix of two sections on medical zoology has been revised, and in it the reader will find all the essentials of medical protozoology, helminthology, entomology, herpetology, and laboratory technique. The book is unique in that there exists no other of its size which gives the reader such a vast amount of practical information regarding the diseases of tropical lands and the methods of dealing with them. It should be in the hands of everyone who practises medicine in the tropics, and it is certain that everyone who has it will be constantly referring to it for guidance and instruction.

MIND AND BODY.

IN a volume entitled *Common Principles in Psychology and Physiology*[2] Dr. JOHN T. MACCURDY makes it his aim to show that the relationship between the psychological and the physiological is not merely one of analogy, but of an essential element common to both. To this abstract, impalpable, immaterial agent, element, or property, which the author assumes may be held accountable for the differences between living and inert matter, he applies the term "pattern"—physiological, psychological, or developmental, according to the level of behaviour at which the manifestations of life are exhibited.

Though the author's formulations are by no means free from obscurity, they well repay careful study on the part of those who are interested in the ultimate problems of life and mind. Any serious attempt to bridge the gap between the psychological and physiological activities of the organism, and to suggest a common terminology, merits consideration. There is a tendency to think of physiological and mechanical behaviour under one head, and "mental" behaviour under another. It would certainly appear to be more in conformity with facts to consider inorganic reactions under one head, and physiological and "mental" under another, for the distinction which is apt to be drawn between physiological activity and overtly manifested conduct, associated with consciousness, does not seem to be justified. Psychology deals with additional facts about the living organism with which physiology is not concerned, but it cannot be held to deal with phenomena of an essentially different order. In their last analysis the physiological activities of the organism are not more impressive and remarkable than those of the individual. It is highly probable, indeed, that the medical practitioner may sometimes feel that the "wisdom of the body" is in striking contrast to the foolishness of the man. Thus it seems essential for us not to think of mind and body, of mental and physical, but of the living being and life. Nor can consciousness be relegated to the position of an epiphenomenon; it is a manifestation of life which is possibly dimly present in the lowliest forms of organism. Many writers have expressed similar views. Thus, Dr. C. S. Myers observes, "The problems of life that confront the physiologist are almost precisely those of mind which confront the psychologist. Life and mind must ultimately be described in similar terms." What these terms are is the problem which Dr. MacCurdy sets himself to answer, and apart from certain elusive differences his answer appears to be similar to those suggested by various other writers, for it is essentially his claim that it is the reappearance of the past in the present which differentiates the organic or living from inorganic nature. Like Bergson in the sphere of philosophy, and Semon and Rignano in that of biology, Dr. MacCurdy believes that evidence of the inherency of the past is to be found in the present at both the psychological and the physiological level of behaviour, and that it is this characteristic which distinguishes living from inert matter.

We do not wish to suggest that Dr. MacCurdy's formulations are identical with those elaborated by other writers. He does not accept the view of Semon, for instance, that the impress of experience is some kind of a physical alteration of protoplasm, and that the *mneme* and memory are reducible, fundamentally, to physico-chemical laws. On the contrary, he assumes the existence of unconscious immaterial images—immaterial in the same way that conscious images are immaterial—and develops this concept throughout his book, applying it not only to the whole

[2] *Common Principles in Psychology and Physiology.* By John T. MacCurdy, M.D. Johns Hopkins. The Cambridge Psychological Library. London: Cambridge University Press. 1928. (Roy. 8vo, pp. xvii + 281. 15s. net.)

range of phenomena of psychology, but to the whole range of physiological phenomena as well. Thus this work is, in a considerable measure, a definitely personal contribution to the subject with which it is concerned. In order to grasp the ideas of the writer a cursory study of his book will be found inadequate.

A VENERABLE TEXTBOOK OF PHYSIOLOGY.

A FEW textbooks of science there are which seem, themselves, to be the very stuff of which their subject is made. They belong to their science; they have grown up with it; they have grown old in its service—yet have not lost their youth. Such a book is Halliburton's *Physiology*.[3] Born into a world where laboured Claude Bernard, Ludwig, Liebig, and other "fathers" of modern physiology, this textbook, with the maiden name of *Kirke's Physiology*, has lived through thirty-one editions, and to-day meets us "completely revised," authoritative, venerable—but with no signs of senescence, none of that irritability which may come with age, no weariness of the flesh.

It was a happy thought of the publishers to preface the present edition with a brief unostentatious historical note. *Kirke's Physiology* appeared first in 1848 as a comprehensive work based upon the lectures of Sir James Paget at St. Bartholomew's Hospital. It rapidly won the regard of medical students, and during fifty years passed through thirteen editions, under the editorship of a succession of teachers at this great school of medicine. At the end of the last century, however, the long association with "Bart's" was severed, and the book became Halliburton's *Physiology*. Under the care of Professor W. D. HALLIBURTON a further seventeen editions have been published in a quarter of a century. With the retirement of Professor Halliburton from active teaching, however, a period of four years elapsed without revision of the text, but now continuity is assured by the appearance of the present edition. In the preparation of this the author has had the assistance of Professor R. J. S. MCDOWALL, his successor in the chair of physiology at King's College.

"There have been considerable rearrangements, both in the order of the chapters and within the chapters. Some have been rewritten, for instance, many on the Nervous System, so as to bring Reflex Action up to date, and to admit of adequate treatment of Postural and Conditioned Reflexes. The sections on the Autonomic Nervous System, Speech, the Control of the Circulation, the Carriage of Carbon Dioxide, the Maintenance of Body Neutrality, the Vitamins, Ductless Glands, and Intermediate Metabolism are also for the most part new. Additions have been made on the following subjects: the Formation of the Blood and the Bile, Test Meals, Blood Groups, the Polygraph, recent work on the Spleen and the Control of Respiration, the effects of Exercise on the Respiratory Exchanges, and other matters. To admit of this new material anatomical detail has been reduced, but essential anatomy and histology are retained. Particular stress has been laid upon the requirements of the medical student by omitting less essential details and emphasizing principles."

This is certainly a generous revision, and the senior author acknowledges his indebtedness to Professor McDowall for the greater part of the new material. It is a pleasure to record that the well-balanced and careful presentation of the latter gives ample assurance that the cloak of teacher has fallen upon shoulders which can carry it with authority. The book has actually been reduced in size. It is an interesting reflection that it contains only two hundred pages more than the first edition, which appeared eighty years ago, when, as we are inclined to think, physiology was very young and very ignorant. There is little more that a reviewer may usefully add save the suggestion that there are occasions when it is meet that we should praise famous books and their authors. Physiology has been fortunate in her teachers. But in the group of famous names which come to mind there can be none more familiar to English-reading students than that of Professor Halliburton. During the twenty-nine years of his editorship more than one hundred thousand copies of this book have been worn thin in the service of students. This tattered army were monument enough.

LEUCOPLAKIA AND KRAUROSIS OF THE VULVA.

THE differentiation of leucoplakia and kraurosis from one another and from allied conditions of the vulva is still so far uncertain as to make the clinical and pathological study by Sobre-Casas and Carranza of Buenos Aires well worth attention by gynaecologists.[4] It is published as a monograph, the greater part being occupied by photographic and coloured reproductions of the naked-eye and histological features of cases selected from the forty-five under their observation, together with many case records. There are also several drawings illustrative of the surgical procedures advocated in treatment. The chief points the authors set out to make are that these conditions run into one another, so as to be scarcely distinct as clinical entities, that both are precancerous and therefore both call for radical treatment. The etiological steps are regarded by them as prolonged and intractable pruritus, leucoplakia, kraurosis, and finally epithelioma of the vulva.

Chronic irritation with infection of superficial abrasions gives rise to a chronic dermatitis, showing hyper- or parakeratosis, with hyperaemia and leucocytic infiltration of the corium and subsequent desquamation of the horny layer and retraction of the tissues: this has been generally accepted as the explanation of leucoplakia. In order to distinguish it from those conditions in which the primary cause appeared to be more a regressive atrophic change—that is, kraurosis—emphasis was laid on the thinning and retraction of the tissues and the more marked contraction of the introitus with little tendency to ulceration and malignant change. The view of these workers, based on their clinical and pathological investigations, is that it is better to regard a leucokraurosis as a condition in which, from divers causes, the skin area may be affected in either or both of these directions. They advocate radical removal in cancerous cases by excision of vulva and thoroughgoing removal of the inguinal and femoral lymph glands, even to the extent of removing those which run up the iliac vessels. Radium and deep *x* rays are employed only as a palliative in inoperable cases or as a measure additional to surgical treatment. The operative treatment must, however, be modified to meet the special features of the case. Because a chronic pruritus without obvious cause and rebellious to treatment produces severe disability often leading to mental disorder, and may be the first stage in a precancerous leucokraurosis, vulvectomy about the age of the menopause is advised, both on curative and prophylactic grounds, but without extirpation of the lymph glands.

EXPERIMENTAL NEUROLOGY.

THE appearance of Dr. E. A. SPIEGEL's book on experimental neurology[5] emphasizes the change which has been taking place during the past fifteen years in the methods of neurological research. The microscope which physicists had contributed towards the furtherance of our knowledge of the minute structure of the central nervous system has been developed to the limit of its resolving power. Chemists may still elaborate stains of more delicately selective action to aid our study of morphology, but the examination of serial sections has probably already supplied most of the information available from this source. Other avenues of approach to the subject are being opened up, and if it is to bacteriological and biochemical methods that we turn for light upon the cause and course of neurological diseases, it is from experimental medicine that we may expect an explanation of their signs and symptoms.

In making readily accessible in this volume most of the physiological work and methods which have a bearing upon this subject Dr. Spiegel has rendered valuable service. The task of selecting the pertinent data from all this material and using them for the interpretation of clinical

observations is one of quite a different order. The temptation to use such data in circumstances where their applicability is not well substantiated is one which the author has in most cases avoided. This has been easier because he has been concerned with presenting all views for consideration rather than with discriminating between them, and in spite of the number and variety of his own researches he has retained an absence of bias which will greatly help towards the undoubted success of this monograph.

METHODS AND PROBLEMS OF MEDICAL EDUCATION.

THE Division of Medical Education of the Rockefeller Foundation, of which Dr. R. M. Pearce is the director, in its series of *Methods and Problems of Medical Education*, is doing great service to the teachers and administrators of medical schools and hospitals by providing them with detailed descriptions of laboratories and clinics in almost every part of the world, especially of those which have been recently organized and equipped.

The tenth series[6] contains no fewer than thirty-three articles, dealing with the teaching of hygiene, pathology, pharmacology, physiology, anatomy, and medicine, and with medical libraries. The physiological departments described include those of the Universities of Alberta in Canada, Debreczen in Hungary, Milan, Berne, Concepcion in Chile, Illinois, and Leeds. An account is given of the teaching of hygiene in the Universities of Alberta, Jassy in Rumania, Yale, and Pennsylvania, in the Royal Hungarian University of Pécs, and in the Western Reserve University at Cleveland, Ohio. Four pathological departments are described—namely, those of the Universities of Illinois, Prague, Florence, and Leeds—and departments of pharmacology at the Universities of Alberta, Tübingen, Pécs, and Illinois. Dr. Tadasu Saiki gives an account of the activities of the Imperial Government Institute for Nutrition at Tokio, and Principal G. H. Macalister of the buildings and departments of King Edward VII College at Singapore. Members of the British Medical Association will be specially interested in the description of the building and equipment of the faculty of medicine of the University of Manitoba, which is situated at Winnipeg, the city in which is to be held the 1930 meeting of the Association. All the articles are, as usual, generously illustrated by photographs and plans.

The eleventh series[7] contains twenty-two articles, all but two of which deal with clinical departments. Professor Howard T. Karsner gives an account of the diagnostic laboratory of the Cleveland City Hospital, in which the principle of centralization has been adopted with success. His colleague, Professor Elliott C. Cutler, in the course of an article on the education of a surgeon, expresses the view that surgery is perhaps more fortunate than its closely-allied partner, medicine, in that, being almost utilitarian, it has less time for philosophy, and finds it is simpler to avoid the larger fluctuations of educational fashion. Further articles deal with the surgical clinic at the University of Königsberg, with the medical clinics at Breslau, Düsseldorf, Strasbourg, the Johns Hopkins Hospital, and Cornell University, the out-patient departments at the London Hospital and at the Johns Hopkins Hospital; and of ophthalmic, dermatological, oto-rhinological, paediatric, and cardiological clinics in various parts of the world. Writing of the Johns Hopkins Hospital, the physician-in-chief, Professor Warfield T. Longcope, says that as the medical wards—almost unchanged since their erection nearly forty years ago when William Osler was in charge—are now antiquated and inadequate, plans are being prepared for new wards which, with the recently constructed out-patient department, will provide a thoroughly up-to-date medical clinic.

NOTES ON BOOKS.

Ciliary Movement,[8] by J. GRAY, F.R.S., is a volume of the Cambridge Comparative Physiology Series. The author points out that there are only two methods of locomotion in the animal kingdom—namely, ciliary movement and muscular contraction—and that therefore the former deserves careful systematic study. The first problem studied is the nature of the movement of cilia and flagella. The various types of movement are described, and an account is given of the various theories that have been advanced to account for these movements. This discussion touches on many problems of considerable interest to protozoologists. Later chapters describe the work done by cilia, the effect of ionic changes on ciliary movement, and the metabolism of ciliated cells. An interesting comparison is made between the laws governing the activities of cilia and those regulating muscle cells. The last chapter is concerned with morphological problems; the distribution of cilia in various types is described and their function is discussed. The author deals with a highly specialized field of knowledge, which he himself has done much to develop. It is interesting to note how many problems of fundamental physiological importance become involved in the discussion of this apparently limited field. One problem of great interest is how the activities of the cells of a sheet of ciliated epithelium are correlated so as to produce the wave-like activity that is termed metachronal rhythm. This co-ordination appears to be effected by some mechanism unlike any known in other forms of living tissue.

Mr. W. S. TAYLOR, professor of psychology in Smith College, is responsible for a concise and useful little book on *Morton Prince and Abnormal Psychology*.[9] He feels that a brief exposition and discussion of the psychological theory of a psycho-pathologist whose reputation has travelled far is needed, since students of mental life are liable to associate Dr. Prince's name more particularly with his dramatic and vivid study of the case of Miss Beauchamp, and, in consequence, they may fail to gain an adequate appreciation of the extent or value of his contributions to psychology generally. It is worthy of attention, as Mr. Taylor justly observes, that Dr. Prince's views are not put forward as a finished system. Only a cult could be so represented, and cults are the bane of science.

Rather more than a year after the appearance of the first edition it has been found necessary to publish a second, and revised, edition of EMERSON'S *Physical Diagnosis*,[10] which was reviewed in our columns on September 22nd, 1928 (p. 530). It is satisfactory that the new lines adopted by the author have proved so popular, and there is no doubt that the book has a very real value. We still think that some reference to the origin of visceral pain might have been included; this is, perhaps, the only defect in an otherwise excellent volume.

SMALL-POX.

STATEMENT BY MINISTRY OF HEALTH.

THE Ministry of Health issued, on April 25th, the following note on the present situation in regard to small-pox.

"Small-pox of mild degree has been prevalent in England and Wales, as in other countries of Europe and America, during the last few years, and the following table sets out the number of cases since 1926, with the number which has already occurred in 1929 up to April 13th.

Small-pox: England and Wales.

	Cases.	Deaths.
1926	10,141	11
1927	14,787	36
1928	12,420	53
1929 (to April 13th)	3,899	16*

* Approximately (exact figure not available).

"It should be understood that these returns include a certain small number of cases of small-pox of severe degree in 1926.

"The distribution of this small-pox of mild degree has been relatively wide, but it has been kept under control or stamped out in all of the thirty-five or forty counties in which it has appeared except in some five to ten districts. But owing to the

relatively high proportion of unvaccinated persons in the population of certain areas, or to neglect owing to the mildness of degree of the malady, the disease has obtained more foothold in those areas. For instance, in the present year most of the cases are concentrated in Durham, the West Riding of Yorkshire, Derbyshire, Northamptonshire, Essex, and Glamorganshire. Where vaccination has been properly carried out, and where the public health administration has been vigilantly practised, this form of small-pox of mild degree has not spread.

The "Tuscania" Cases.

"Some uneasiness has been aroused over what is known as the *Tuscania* cases, but risk of any general outbreak from this source of infection is now at an end. The facts are as follows:

"On March 27th the Anchor Line s.s. *Tuscania*, from Bombay, arrived at Marseilles with passengers and crew numbering 1,589. Two members of the crew had, during the voyage, suffered from a malady which appeared to be chicken-pox, but turned out to be small-pox, and one of them died from small-pox on arrival at Marseilles. Some 400 passengers left the liner at Marseilles on March 27th, and travelled direct overland to London and elsewhere. The majority, however, remained on board ship bound for Liverpool. On arrival at Liverpool some 650 passengers disembarked, and information was sent by the Liverpool port authorities to the districts to which they were stated to be proceeding in order that direct personal supervision should be imposed upon them and continued for not less than fourteen days. This practice of supervision has long been adopted in England, and now forms part of Article 42 of the International Sanitary Convention of 1926. Several passengers and the crew subsequently proceeded on the *Tuscania* to Glasgow, where similar action for supervision was taken.

'On receipt of the information thus provided, the central and local health authorities in this country have proceeded in the ordinary way in regard to notification, isolation, disinfection, and strict supervision of all 'contact' persons. It is, however, obvious that if a number of persons apparently healthy at the time of disembarkation leave a ship that has been infected with such a disease as small-pox, it is probable that there will be a number of secondary cases of infection, provided that such persons had not been adequately vaccinated before their contact with the infection. Therefore, although belated vaccination had been offered and practised between Marseilles and Liverpool, 45 persons from the *Tuscania* (out of 1,589) have been notified as suffering from small-pox, 28 in England and 14 in Scotland, the 3 others occurring elsewhere. The English cases occurred in the following districts: in and around London, 13; in the North of England, 7; and in the South, 8. Of the 14 cases in Scotland, 13 occurred in or near Glasgow, and 1 at Aberdeen. The number of deaths up to date has been 7, of which 6 occurred in this country and 1, as stated above, at Marseilles. The date on which the last London case sickened with small-pox was April 7th. The incubation period of small-pox (fourteen days) has expired. It is possible, and indeed probable, that there may be cases of tertiary infection, but speaking generally it may be assumed that the rigorous measures which have been taken in this country have been effectual, and the English ports have been kept free. There was a statement in the Continental press last week that there were not less than 100 cases at Southampton. In point of fact, there have been no cases whatever at Southampton this year, and only 2 in the summer of last year. It has also been stated in the Continental press that small-pox was 'rampant' in London. In point of fact, there have been 167 cases of mild degree in the administrative county of London this year, among a population of 4½ millions. This figure cannot, of course, accord with the number of patients treated in the Metropolitan Asylums Board's hospitals, because cases are admitted to these hospitals from outside London.

"When the *Tuscania* cases occurred, public attention was drawn in France to that incident, and also to the prevalence of small-pox of mild degree in England. Very naturally, France desires to safeguard herself against the invasion of small-pox from Britain, and the action which has now been approved by the French Government is in strict accord with Article 42 of the International Sanitary Convention of 1926, which has been ratified both by France and England. The arrangement is that, if and when unvaccinated travellers from England desire to enter France, they shall furnish the French authorities with their names and addresses in France in order that they may be kept under appropriate supervision until the incubation period (fourteen days) has expired. If they furnish evidence of recent vaccination they obtain 'free pratique'; if they cannot furnish such evidence they are to be provided en route with a card (sanitary passport) on which their name and address will be entered, and they may be called upon to produce this card in the same way that they are called upon to produce a ticket or a passport, and to satisfy the authorities of the district they visit that, within the incubation period, they remain free from small-pox.

"It will be seen [the Ministry's statement concludes] that the great bulk of cases which have occurred in recent years have been mild in degree, and that while the *Tuscania* cases have resembled the more virulent type formerly prevalent, the number of cases has, thanks to the precautions taken, been comparatively small, and any danger of widespread infection from this source may now be said to be at an end."

CONFERENCE ON MENTAL WELFARE.

ADMINISTRATIVE PROBLEMS RELATING TO DEFECTIVES.

A largely attended conference under the auspices of the Central Association for Mental Welfare was held at the Central Hall, Westminster, on April 25th and 26th. The principal matters discussed were the effect of the Local Government Act on the work of local authorities in relation to the mentally deficient, and the report on mental deficiency by the joint committee of the Board of Education and the Board of Control. The latter was the subject of a leading article in our issue of April 27th (p. 775).

Address by the Minister of Health.

Mr. NEVILLE CHAMBERLAIN opened the conference with an address in which he referred to some unsatisfactory features of present administration with regard to mental deficiency, such as the variation in the way in which the statutory duty of ascertainment was carried out by different local authorities, the grave shortage of institutional accommodation, and the lack of supervision and training of non-institutional defectives. He was advised by the Board of Control that so far no single authority had provided sufficient accommodation for its own needs. In view of the fact that it was now sixteen years since the Mental Deficiency Act was passed, this was gravely disturbing. He went on to defend—apparently conscious of some hostility in his audience—the new Local Government Act, saying that those who had criticized it on the ground that a block grant system would not give the same encouragement to local authorities to carry out their duties as was afforded by the percentage grant, had failed to appreciate how far short of expectations were the accomplishments of the last sixteen years under the latter system. While the percentage grant had stimulated the progressively minded local authorities to extend their accommodation, it was not sufficient to tempt the poorer local authorities to draw upon their meagre resources for the purpose of this—as he must call it—unpopular service. The new system was going to take away from local authorities all excuses for not bringing up this service to what it might be. ("Question.") Well, everyone was entitled to his opinion, and time would show who was right. Mr. Chamberlain added that he had endeavoured in this measure to secure the support of voluntary bodies, among which the Central Association for Mental Welfare ranked high. There need be no anxiety as to any ill effect of the Act upon its work or influence.

The Local Government Act and Mental Deficiency.

A discussion followed the Minister's address on the effect of the Local Government Act on the work of local authorities. Mrs. PINSENT, a member of the Board of Control, expressed her belief that the provisions of the Act would lead to a better classification both of the existing institutions in any one district and of the persons concerned,

and this would lead to efficiency, economy, and more humane treatment of a section of the population much to be pitied.

After some criticisms of the Act, which was described by the clerk to one local authority as a "bombshell," had been made, Dr. H. B. BRACKENBURY remarked that whatever opinions might have been held as to this measure while it was passing through Parliament, it was now on the statute book, and there was no use in further argument as to whether it was what might have been desired. It would be generally agreed, however, that it was a very big step forward to that unification of the administration of health services which had been held up as the ideal for many years. While it might not be possible to rely upon a particular authority to accomplish a great deal in the way of unification, it was important to remember that there would be one council clerk and one chief administrative medical officer dealing with all these matters, and this extension of the functions of the principal executive officers to cover the whole field of local administration was a very noteworthy thing. A good deal would depend, of course, upon the personality of these officers, but, assuming that they knew their work and intended to do it in the most helpful way, the fact that there would be one administrative officer was a great gain. With regard to the committee of the local authority which should act in respect to mental deficiency administration Dr. Brackenbury differed from Mrs. Pinsent, who had suggested the Asylums Committee. In his opinion it was the Public Health Committee which should be entrusted with these functions. From both the medical and the social point of view, the problems associated with mental deficiency and retardation were quite different from those of mental disorder and lunacy.

Sir LESLIE SCOTT, who occupied the chair, said that the new legislation would prevent the anomalous position whereby mental defectives who happened to be poor were dealt with by an authority different from that which dealt with more wealthy mental defectives. Mental deficiency would in future be dealt with as it ought to be—as a health matter.

The Incidence of Mental Deficiency.

Sir FREDERICK WILLIS presided over the session when the discussion took place on the report of the joint committee. He made an allusion to the non-publication of Part III, declaring his ignorance as to the reason for withholding, adding ironically that he trusted no such objectionable passages had been discovered in the document as had led to the banning of a recent notorious novel. Dr. A. F. TREDGOLD, a member of the joint committee, also thought the non-publication to be most unfortunate. He could not but feel that some mysterious influences were at work. It was remarkable that there should be any hiding of the carefully considered opinions and recommendations of an independent committee on so important a subject. Dr. Tredgold then described the special investigation on behalf of the joint committee, which had occupied Dr. E. O. Lewis and his staff for two and a half years. The Royal Commission in 1906 came to the conclusion that there were 4.6 mental defectives per 1,000 population—that is, 150,000 defectives in England and Wales. Dr. Lewis's conclusion was that the number was 8 per 1,000, equivalent to a total of 314,000. This higher incidence might be due to a more complete ascertainment, but this did not meet the whole case. While Dr. Tredgold would not suggest that the incidence of mental defect in the community was double what it was a generation ago, nevertheless he could not resist the conclusion that there had been a definite increase in proportion to the population. Possibly the cause in part might be the reduction in infant mortality, whereby a certain number of mental defectives survived; another possible cause was the differential decline in the birth rate. After discussing employability and the classification of defectives from the administrative point of view, Dr. Tredgold added that it was quite clear that there were a large number of defectives in this country urgently in need of institutional care, which at present did not exist. It was doubtful whether the neglect to provide these institutions resulted in any saving of money, and it certainly entailed hardship on the individual.

Professor CARR SAUNDERS of Liverpool pointed out that the full importance of mental defect was not to be measured by the monetary burden. It was not quite true to say that the strength of society was the strength of its weakest link, but this was becoming more nearly true. With social progress there was greater integration and interdependence than before, and this implied that each defective was of relatively greater importance, because a greater drag upon the normal community. Dr. E. O. LEWIS, who carried out the investigation under discussion, also made the point that the mental deficiency figures were an index to a much larger problem. For every one defective thirty others were of subnormal mentality, so that a small increase in the figures for mental deficiency represented a very considerable increase in what might be called the social problem group. Miss EVELYN FOX, another member of the committee, declared that local authorities had failed to secure an adequate number of officers trained in social work, without whom it was impossible to adjust the problem of the defective.

Other speakers referred to what one of them called the "deplorable permission to propagate," and the need for rousing public opinion in favour of measures to prevent propagation. The rural slum, where the very lowest degeneracy was said to be reached, was also mentioned. One speaker suggested that the reason for the apparent increase in the number of mental defectives might be sought in the greater numbers who had applied for relief in recent years in consequence of industrial troubles, with the result that mental deficiency was discovered where it had not been supposed to exist.

The Retarded Child.

The final subject to which the conference addressed itself was that of the retarded child. The discussion was opened by Professor CYRIL BURT, who pointed out some further implications in the report of the joint committee. It appeared that about 1.8 per cent. of the school population in towns were feeble-minded, and nearly double that number in country districts. Applied to the whole country these percentages yielded a total of 90,000 children, or six times the number in attendance at certified special schools. These 90,000 were but the tail-end of a far vaster group of borderline cases. Wherever psychological tests had been applied to large samples of the school population, it had been shown that not only did the normals and defectives overlap, but there was no clean-cut cleavage between them, any more than between day and night. "You cannot diagnose mental deficiency as you diagnose small-pox." Dr. R. H. CROWLEY, senior medical officer of the Board of Education, said that it was in the large group of retarded children—not the mentally deficient—that most delinquents were found. He made a plea for what he called a fresh orientation of ideas and practice with regard to the backward child and his behaviour problems. It was on the behaviour problem that the attention of teacher, social worker, and psychologist should be concentrated.

Many speakers, mostly teachers, took part in the subsequent discussion, which, thanks to the action of the chairman, Mr. MORGAN JONES, M.P., escaped—though narrowly—developing a political bias. The creation of a new educational unit for the retarded child was welcomed, and the need for extending the school-leaving age, above fifteen for such children was emphasized. Some experiments in education and training were described. Mr. TIPPER, director of education, Westmorland, gave an account of an experiment in that county where a teacher specially trained for the purpose was employed to visit the schools which had dull and backward children in order to assist in devising methods for dealing with them. Miss MARSDEN, inspector for the Nottingham Education Committee, described a scheme adopted there whereby each child at seven was given a simple mental test in order to classify him according to his mental age. The names of all subnormal and possibly mentally defective children were sent to the senior medical officer, who tested the children in greater detail and decided whether they were suitable for special classes or how they might be most advantageously dealt with. Finally MONSIGNOR NEWSOME described the experiments at Besford Court, where the Montessori method of educating young mental defectives and the vocational training of older children are carried out.

British Medical Journal.

SATURDAY, MAY 4TH, 1929.

ASPECTS OF RENAL DISEASE.

IT is an early and elementary warning to students of medicine never to omit, in their diagnostic enterprises, the examination of the urine, the sanction of this advice being the fact that renal disease may exist without symptoms that obviously suggest it. A parallel lesson is that the discovery of albuminuria is not necessarily incompatible with sound health. Thus the duty of completeness of observation and the necessity for differentiation appear at the outset among the habits that are urged as the only sound foundation for clinical practice. Effectively to apply these counsels presents no great difficulty in the particular instances above indicated, though it may be allowed that the proof in an individual case that an albuminuria means neither renal disease nor any other disease demands the establishment of something like a universal negative. Still, the task can be accomplished even though the doctrinal explanation of the fact is not quite a confident one. When, however, for good and sufficient reasons, the conclusion is reached that albuminuria detected on clinical examination certainly means renal disease, the attempt to determine the type or character of the disease is not infrequently attended with many difficulties; and one of the causes of these difficulties is the varied classifications of nephritis with which authors and textbooks confront us.

At one time the pathological anatomist possessed the field. A limited number of structural pictures or plans were described, and into one or other of these groups the physician was expected to fit his patient. To fail was to be guilty of an error in diagnosis. Time has seriously disturbed this claim, and the attempt to correlate the clinical record with the post-mortem appearances of the kidney has not proved universally successful. Hence diagnostic phrases based on the assumption of particular structural alterations in the kidney are widely recognized to be inadequate, for now and again, without any question, clinicians of experience expect from the symptoms and record to find one pathological type of kidney, and as a fact find something quite different. In recent years, and to an increasing extent, disturbances of function rather than anatomical changes have been adopted as a basis for the classification of the varieties of nephritis, and in some instances this basis has been used for a very simple, perhaps a too simple, clinical grouping. Simplicity is, of course, attractive, but after all the facts must govern the situation, and it cannot be said that the clinical study of renal disease presents facts which readily fall into a very limited number of groups. The present position is that the severe anatomical basis of classification has been severely shaken; quantitative measurement of the degree of functional disturbance is gaining recognition; and in the existing transitional and tentative stage a quite sharp and confident scheme of classification able to accommodate all experiences is hardly possible.

Nevertheless, the practical demands of the situation, as well as the need for helpful discussion, require some generally agreed basis and grouping, and as a contribution to these ends the British Medical Association Lecture by Dr. Langdon Brown, which we print at page 797 this week, has obvious value and interest. The scheme of arrangement (modified from Aschoff) is comprehensive, and the classes and subclasses are well defined. The names are familiar, and suggest actual renal conditions. On the other hand, the classification which would allow only two forms of nephritis—hydraemic and azotaemic—seems almost too simple to be true, and the names are free from any suggestion of actual renal change. Possibly this last-mentioned quality is a virtue when, as is not infrequent, a given *clinical picture cannot* with certainty be interpreted as significant of a given series of structural renal changes. Yet, *after all*, when thinking and speaking of the kidney it seems almost inevitable that some outline of the actual renal condition must be present to the mind's eye. It may be that further attempts to correlate the microscopic features of diseased kidneys with the clinical records as these are studied by the physician will be successful. Though the macroscopic facts of the post-mortem room have not been fully helpful in this respect, it does not follow that histological studies will fail, though, truth to tell, details of the destroyed edifice cannot with much hope be counted on for a definition of the source and characters of the conflagration. In the meantime the practice of medicine must be carried on, and a working scheme, even allowing that it has defects, is better than no scheme at all.

In the text of his lecture Dr. Langdon Brown discusses both the weak points in his tabular grouping and also the possibility of overlapping and of intermediate cases. To read the lecture is an opportunity for noting that an experienced physician, while recognizing the value, or, indeed, the necessity, of classification, keeps classification in its proper place, and uses it to help, not to dominate, the study of facts. Facts remain and will be repeated. The grouping of them will doubtless be modified by the pressure of time and the event.

Another illustration of the modern tendencies in medicine as discussed in the lecture is the advocacy of quantitative chemical analysis as this may be applied both to the urine and to the blood. The younger generation of practitioners is growing up under influences of this order, and though the standard is a high one and not easily to be attained, the service both to exactness of diagnosis and prognosis and to confidence in treatment is beyond question, and a levelling up of practice to these claims may therefore be expected. Some of the chemical tests may perhaps always need laboratory observation and skill; but this is not true of all the tests by which the function of the kidney can be estimated, and the desirable thing is that the practitioner, so far as possible, should cultivate first-hand knowledge and depend on his own observations. Whether such a view is accepted or not, it is manifest that the demand is for greater precision and a more searching investigation in every attempt to estimate the functional value of the kidney when diagnosis and prognosis have to be practised. If the standard is a severe one the reward is to be found in increased scientific knowledge and in added practical values. The broad position that has to be faced is that renal function may be much impaired with little structural change; while, on the other hand, destruction, and even considerable destruction, of the renal tissues may yet leave a large measure of functional efficiency. Evidently, therefore, the demand on the practical plane is for an estimate of the function of the kidney, and particularly of its function as an excreting organ.

A feature of Dr. Langdon Brown's lecture that should gain immediate recognition is the attention he gives to the subject of treatment. Even here, as in the issue of classification, there are differences of opinion, and it is an obvious advantage to have on record the experiences of a physician who speaks after having equipped himself with a large and carefully garnered body of first-hand observation and knowledge. In respect both to diet and drugs Dr. Langdon Brown has arrived at conclusions which do not always fit conventional and traditional teaching, but they are not on this account less worthy of attention. Altogether the lecture presents our readers with a summarized view of the trend of modern opinion in regard to the various forms of nephritis, with the investigations needed to establish diagnosis and prognosis, and with directions for treatment which rest on the basis of personal observation and experience. It may be, as the lecturer says, that modern investigations of the clinical and pathological problems associated with nephritis are disputing what until yesterday seemed to be well-established and admitted teaching, with consequent disturbance and uncertainty of opinion. The challenge, as many recent writings show, is indeed a very radical and inclusive one, and as it bears upon practice in relation to forms of disease that are far from infrequent it needs general attention. Nor are the issues to be settled purely by chemical tests and laboratory experiments. There is room and opportunity for clinical observations and records, and this more especially in the more chronic forms of renal disease. It is not without interest in this connexion to note that it is for an investigation of this order, conducted over a period of thirty years, that the Council of the British Medical Association, as announced in the *Supplement* to our issue of April 20th (*p.* 104), has awarded to Dr. Arthur Crook the Sir Charles Hastings Prize for 1929.

A NATIONAL RADIUM FUND.

ON April 16th the Chancellor of the Exchequer announced that the Government had undertaken to contribute out of public money towards the purchase of radium, on a basis of £1 for every £1 otherwise subscribed, up to a limit of £100,000. A public appeal for £150,000 (making £250,000 in all) to form a "National Radium Fund" has now been set on foot by leaders of the medical profession acting in concert with laymen prominently associated with the work of hospitals and cancer research. The purpose and scope of the fund were indicated in a letter published in the *Times* of April 29th, over the signatures of Sir John Rose Bradford, Lord Moynihan, Lady Barrett, Sir E. Farquhar Buzzard, Lord Dawson of Penn, Dr. Robert A. Fleming, Lord Gorell, Sir Thomas Horder, Lord Knutsford, Mr. J. P. Lockhart-Mummery, Sir Ewen J. Maclean, Dr. J. M. H. MacLeod, Mr. Alexander Miles, Lord Reading, Sir Humphry Rolleston, Sir Arthur Stanley, Lord Stanmore, Sir StClair Thomson, and Sir John Bland-Sutton.

The money obtained in this way, together with that contributed by the Government, is to be held by a body known as the National Radium Trustees, who will buy therewith and hold radium for use by an administrative body of experts known as the National Radium Commission. The Trustees are being constituted by the Government in accordance with one of the recommendations made by the Radium Subcommittee of the Committee of Civil Research,[1] but with two additional medical members to be nominated from their own number by the Radium Commission. The composition of the latter body has been modified so as to ensure adequate representation upon it of those familiar with the use of radium in medical practice, and its membership has been increased from nine to eleven. The Commission will thus consist of a chairman, appointed by the Trustees; six members, appointed by the Trustees from a list of names drawn up by the titular heads of the medical profession; and four members nominated respectively by the Minister of Health, the Secretary of State for Scotland, the Medical Research Council, and the Department of Scientific and Industrial Research. The general effect of these changes in the administrative framework of the scheme put forward by the Radium Subcommittee is summed up in the letter published on April 29th: "The radium will be bought and held by a body of Trustees which has the confidence alike of His Majesty's Government and the medical profession. It will be administered by a Commission which will contain an effective majority of members representing the skilled and experienced workers on the staffs of the voluntary hospitals."

The national appeal for radium is being made conjointly with a special appeal by King Edward's Hospital Fund in aid of the hospitals in the metropolitan area as a thank-offering for the King's recovery, the nucleus of the latter project being 100,000 guineas offered by an anonymous benefactor. Lord Donoughmore is acting as treasurer of the combined appeals, and arrangements have been made by the King's Fund so that contributions ear-marked for the purchase of radium for the needs of the whole country will be applied to that purpose through the National Radium Fund; such gifts should be marked "Radium," and sent to the Treasurer of the Thank-Offering Fund, at 103, Kingsway, W.C.2. Any doubts and misgivings about the constitution of the National Radium Commission having now been removed, the medical profession will whole-heartedly support this appeal. The first list of subscribers was headed with the names of the King, the Queen, and the Prince of Wales; and His Majesty has expressed warm approval of the decision to amalgamate the two undertakings.

[1] A full account of the subcommittee's report appeared in the *British Medical Journal* of April 27th, p. 772

THE LONDON ZOOLOGICAL SOCIETY.

ONE hundred years ago King George IV granted to the London Zoological Society a royal charter "for the advancement of zoology and animal physiology and the introduction of new and curious subjects," and on Monday last, at a special meeting held in University College, London, the society celebrated the centenary of this great event in its history. The study of zoology has always had a special attraction for medical men; the subject forms, and of necessity must always form, an essential part of the curriculum of the medical student, who, because he must become biological in outlook, has to realize that medical science itself involves but the intensive study of one of the highly developed animals. Many of the most celebrated zoologists have belonged to our profession, or else, like Charles Darwin, have been diverted to specialization in zoology while engaged in the study of medicine. Small wonder, then, that a large number of physicians and surgeons are not only Fellows of the Society, but are actively identified with its activities. The post-mortem room has been called the Palace of Truth from which many who have entered with one label have departed with another. No less valuable than the necropsy on the human subject is the study of comparative anatomy and pathology conducted in the society's prosectorium, and it is noteworthy that famous

men closely associated with that work—Richard Owen, Huxley, Alfred Henry Garrod, W. A. Forbes, H. G. Plimmer, Murray, Elliot Smith, and Leiper—have also been members of the medical profession. Perhaps it is because for the past few years all the comparative anatomists of the society and its pathologists have been medical men that much of their contribution to knowledge has had a direct bearing on human health and sickness. Human anatomy has been enriched by Somtag's work on the primates; the work of Bland-Sutton and H. H. Scott, now being ably continued by A. E. Hamerton, has added largely to our knowledge of human pathology. Even more than anatomy and pathology, the science of parasitology—because its study in man is inseparable from its study in animals—has been advanced in the society's prosectorium. Notable in this connexion is the work of Beddard and Nicoll before the war, and since then of Leiper and his colleagues, who, moreover, have rendered invaluable service by providing a number of the younger parasitologists with material for study. Though the medical profession as a whole has appreciated the value of comparative medicine only since the war, many of its leading members have long been engaged in its study, and nowhere more fruitfully than in the London Zoological Society's gardens. In this connexion our profession owes a deep debt of gratitude to the society, and in particular to its brilliant secretary, Dr. P. Chalmers Mitchell, without whose assistance it is probable that much of the research work in comparative medicine could never have been carried through. The appointment of Dr. G. M. Vevers to the post of superintendent, hitherto occupied only by professional zoologists, is a further guarantee that every opportunity will be taken to foster the relation between zoology and general medicine. But research work has by no means been confined to the prosectorium. The new aquarium has provided a vehicle for investigating problems intimately connected with one of our most important food supplies; the gardens themselves have afforded conditions unattainable in the laboratory for the study of economic zoology; and the library, one of the finest of its kind, offers the student and worker the whole range of zoological literature. We congratulate the society on its *hundredth birthday*. Not only has it captured the popular imagination as no other similar society in any part of the world, but it has prosecuted and encouraged active research into problems of fundamental importance to human and comparative anatomy. It enters its second century with the best wishes of the medical profession.

LOCAL GOVERNMENT ADMINISTRATIVE SCHEMES.

Four documents with reference to the submission of administrative schemes under the Local Government Act, 1929, in addition to the general circular on which we commented a fortnight ago (p. 735), have now been issued by the Ministry of Health to the councils of counties and of county boroughs in England and Wales. They are a memorandum addressed to county councils outside *London*, a similar memorandum addressed to county borough councils, together with, in each case, a model administrative scheme. These documents are of great importance, not only to the councils for whose use they are prepared, but also to medical officers of health and medical practitioners in general, and especially to the Branch Councils and Divisional Executive Committees of the British Medical Association, upon whom now rests the duty of securing that the administrative schemes conform, so far as possible, to the general requirements which the Association considers to be in the interests of public health. The memorandum and model scheme for county boroughs are naturally somewhat simpler than those for counties, but both have some features to which particular attention may well be directed. The council has first to make a detailed declaration of all those services in assistance to necessitous persons which it will provide exclusively by virtue of the Public Health or other Acts and not by way of poor relief. The Minister indicates that this declaration must be as widely embracing as possible in each case, and in an appendix sets out all the services which, under several Acts, may be provided in this way. It is, however, pointed out that "the making of such a declaration places the council, in so far as destitute persons are concerned, under an obligation to exercise the powers which they have under the special Acts, and, accordingly, a formal declaration should not be made until adequate resources can be placed at the disposal of the committee administering the special Act." The council, therefore, in some cases, may wish at first to make a scheme meeting only the immediate necessities of the transfer; but any such scheme can be revised and amended at any time by a further scheme similarly made and approved. Even where the including of some service in a declaration is not immediately practicable it will often be possible for a particular Poor Law institution to be appropriated for the purposes of a special Act. "Where, for example, hospital provision cannot be made for a whole county, it may be practicable to appropriate a particular Poor Law infirmary for use as a public hospital under the Local Government Act, 1888, and still to keep in operation the Poor Law powers of relieving the sick poor in so far as other accommodation for them is required." The same would apply to a home for mental defectives under the Mental Deficiency Acts. Next to the declaration as to what services are to be provided otherwise than through the Poor Law, the council must specify its choice between several alternatives for the constitution of its Public Assistance Committee. This committee may be either (1) a new committee with or without co-optative members, (2) another existing committee appointed to act as the Public Assistance Committee, or (3) the members for the time being of another committee of the council, together with additional members who may be either members of the council or co-opted persons who are not members of the council. In practice, if the second of these methods be chosen, it will probably be found that the Public Health Committee is the only one which can conveniently so act. Incidentally it is pointed out that the powers of co-option conferred by the Act on the councils with regard to their Public Health Committees and certain subcommittees can at any time be exercised, and do not need to be mentioned in an administrative scheme. However constituted, it is clear that the business of the Public Assistance Committee must involve on occasion the prompt taking of decisions to be followed by immediate action, and that therefore the councils should use their power of delegating to the committees appropriate responsibility and duty. This may be done with or without reservation, except as regards the raising of a rate or borrowing money; and accordingly the model scheme contains a clause making such delegation and setting out reservations thereto, and a number of definite duties which the committee must perform. Both these categories may, of course, be varied in individual schemes. In the county model scheme the constitution and functions of the local Guardians Committees are also set out. These clauses will require careful watching in all large counties, for to these Guardians Committees may fall in many cases the actual management of hospitals or other institutions. Lastly, attention should be drawn to the important point that "the scheme may provide that particular functions which have been delegated to the Public Assistance Committee shall be discharged on behalf of and subject to the general control of the committee by another committee of the council. This power is directed to meeting a case in which the special Acts under which a particular committee is working do not extend to a service performed under the Poor Law

which it is, nevertheless, desired to co-ordinate with the special service." The number of matters in connexion with which such power may well be exercised will be considerable. This is decidedly a second-best method of securing co-ordination of health services, but pending further legislation it seems the only practicable course. It is of importance to see that the clause embodying this provision is included in every scheme. Apart from the four official documents with which we have been concerned, and which relate only to the preliminary action to be taken by councils with regard to administrative schemes, there are a number of special points on which the Minister of Health will no doubt feel it necessary to issue additional memorandums. Indeed, already there have been three such documents circulated—a memorandum with regard to schemes (under Section 101 of the Act) for securing payment by the council of annual contributions towards the expenses of voluntary associations, if any, providing maternity and child welfare services, together with a model scheme for counties and for county boroughs respectively. These schemes are of some importance in a good many areas, and, of course, seriously affect the activities of the voluntary associations concerned, but they are of minor interest as compared with the general administrative schemes upon which the efficiency of health services and of public health work is vitally dependent.

A MEDICAL SUNDAY SCHOOL IN PARIS.

A SMALL volume entitled *Leçons du Dimanche*,[1] containing twelve lectures by Paris clinicians, has been edited by Professor Paul Carnot, successor to Professor Gilbert as chief of the medical clinic at l'Hôtel-Dieu. Professor Carnot explains how he wished to keep the busy physicians, practising in the city, in touch with recent hospital developments, and therefore a course of twelve lectures, held at 10.30 o'clock on Sunday mornings at l'Hôtel-Dieu, was arranged between New Year and Easter of last year. Their success was immediate, and it is hoped to make these Sunday lectures an annual event. The present small paper-backed volume is a reprint of the first set of lectures, and its main purpose is to refresh the memory of those who attended them. The chief value of this little book to us in Britain is perhaps the way in which it illustrates the differences between the teaching of medicine in the two countries, and it is interesting to consider what might be the titles of the twelve addresses chosen if such a "Sunday school" could be held in one of the large teaching hospitals in Britain. Would any of the lectures be on such subjects as "Les péri-dextro-viscérites infectieuses" (Carnot), "Les troubles du metabolisme de l'eau chez les hépatiques" (Villaret), or even "Thyroxine et folliculine" (Harvier)? Several of the lectures are naturally on subjects of topical interest everywhere, such as the infections of the nervous system, modern radiological methods in gastro-intestinal disorders, and certain aspects of insulin treatment. The characteristic qualities of the individual lecturers stand out clearly, and the points of view of a dozen representative Parisian teachers are easily grasped by a reader who has never been in Paris hospitals and does not know the kind of medical teaching which exists there to-day. He will, however, be somewhat at a loss to understand a good deal of what is discussed, and would wonder how he would fare and what methods he would use if suddenly transported to take charge of a medical practice in Paris. The independence of French medicine is certainly remarkable, and it follows no lead given by any other country. Its trend is becoming far more difficult to follow than it was a generation ago, and even the close co-operation of the war years seems in no way to have approximated the details of everyday methods employed in practice in France and Britain. The basic ideas of physiology are naturally the same, but what has been developed out of them seems so different. It is to be hoped that this volume of lectures may be repeated annually, to enable those who are interested to keep in touch with the problems which are engaging the attention of the practising physicians of France at the moment.

[1] *Leçons du Dimanche.* Par P. Carnot, Sainton, Bensaude, M. Villaret, H. Renard, A. Baudouin, Dieulafé, Tiffeneau, Halbron, Rathery, Harvier, Chabrol. Paris: J. B. Baillière et Fils. 1929. (5½ × 8½, pp. 273; 29 figures. 20 fr.)

THE HISTORY OF PATHOLOGY.

THE history of pathology has not hitherto engaged the attention of medical students except in a very perfunctory and partial manner, without any definite educational aim. That it might be of distinct educational value appears to have been first recognized by Sir William Osler, who made use of it in his lectures, and Professor Long has emphasized its claim in this connexion. A bewildering mass of detail is now presented to the student in all branches of medicine, and his knowledge is in consequence apt to consist of loosely connected facts. The sense of perspective is to a great extent lost, and the significance of individual facts in relation to the science generally is unperceived. Some guiding thread is needed which will assist him in organizing his knowledge and enable him to place isolated facts in their proper organic position in the general scheme, and to recognize their bearings. It is claimed, with some justification, that nothing serves this purpose better than history; the historical connexion of facts is readily comprehended, and the human and personal element which pervades it holds the attention more firmly than a purely abstract presentation. The history of pathology is, however, a large subject, and the student is not recommended to study it in any considerable detail; but a short abridgement, such as that of Professor E. R. Long,[1] made interesting by personal details relating to notable discoverers, and by indications of the scientific and pseudo-scientific ideas prevailing in the several stages of the progress of civilization, should be helpful to the student. In twelve brief chapters Professor Long has traced, in a readable manner, the progress of medical science from its beginnings, sketching with a skilful hand the evolution of our present conceptions. The book was written with the object of assisting students on the lines indicated above; it is small, so that it may be read in a few sittings of an hour or two each; and an occasional reperusal from time to time would without doubt help students in maintaining their bearings amid the mass of facts which threaten to overwhelm them.

HEALTH IN ILLINOIS.

WE noted a year ago the appearance of the first memorial volume issued by the Department of Health for Illinois in commemoration of its jubilee in 1927, which contained a historical account of the progress of sanitation in the State from early down to recent times. The second volume,[2] which has now appeared, reviews the position of the local health administration. Every city, village, and rural area in Illinois is empowered by law to establish a public health service. The cities may either have boards of health or be administered for health purposes by a commissioner. One health department is described as privately owned, and rural areas in a number of cases are

[1] *A History of Pathology.* By Esmond R. Long, Ph.D., M.D. London: Baillière, Tindall and Cox. 1928. (Cr. 8vo, pp. xxiv + 291; 48 plates. 22s. 6d. net.)

[2] *The Rise and Fall of Disease in Illinois.* Vol. II. By Isaac D. Rawlings, M.S., M.D., in collaboration with William A. Evans, M.D., D.P.H., Gottfried Koehler, M.D., and Baxter K. Richardson, A.B. Illinois: State Department of Health. (Sup. roy. 8vo, pp. 493; illustrated.)

ill provided for. In general the level of competence of health officers is not up to British standards. Of the 2,720 local health officers in the State fewer than 400 have any medical or sanitary training. In some outlying areas, therefore, as is inevitable in a new country in certain stages, administration is still in process of development. Strongly contrasted with these immature communities of Illinois is its chief city of Chicago, which has an intensively organized health service. The phenomenally rapid growth of the city raised health problems of the most varied kind, among the acutest of which were the disposal of sewage and the protection of the water supply. Time was when Chicago drew its water in a natural state from Lake Michigan, and discharged its sewage into the Chicago River, which terminates in the lake. This river had been an offence for years, and various devices had been used to improve it, but in August, 1885, after two days' heavy rain, it rushed in a torrent into the lake, carrying its foulness two miles off-shore across the only water intake of the city, the supply of which was at this date untreated. Amid considerable popular excitement preventive measures were set on foot, and in 1892 powers were given to construct the Chicago drainage canal. This great channel, opened in 1900, reverses the flow of the Chicago River, and carries the waters of Lake Michigan, bearing the sewage of Chicago with them, from the St. Lawrence watershed to the Des Plaines River, and so to the Mississippi. The effect of the drainage canal was soon apparent in the reduction of the typhoid mortality of Chicago. It fell from 27 per 100,000 in 1899 to 10 per 100,000 in 1911. *The introduction of chlorination of the* water supply in 1912 was an added measure of safety. In 1926 *the typhoid* death rate was 0.8. *In view of misgivings* which have been expressed in certain quarters as to the *propriety of transferring* water which might have nourished the St. Lawrence to a purely American river, it is pertinent to note the comment of the writer of this interesting volume that the canal merely renews the flow from Lake Michigan to the Mississippi, "as it had flowed in prehistoric times"!

THE YELLOW FEVER COMMISSION.

HONOUR has now been officially bestowed on the work of Walter Reed and those associated with him in the Yellow Fever Commission by the Congress of the United States, with the full approval of the President. A roll of honour is to be published regularly in the Army Register, and will contain the names of the twenty-two members of the military establishment who participated in the experimental investigation of yellow fever in Cuba. Gold medals are being presented to those who survived and to representatives of those who died; pensions are to be awarded to the sixteen living members and to the widow of one of the soldiers. Commenting on this, the *Journal of the American Medical Association* for March 23rd remarks that the report of these experiments published for the use of the Senate in 1911 is one of the most interesting volumes in American medicine, and our contemporary recalls the vote of thanks to the members of the Yellow Fever Commission adopted by the meeting of the American Medical Association at Saratoga in 1902. The self-sacrifice of those who risked their lives in the attempt to discover the method of transmission of a fatal epidemic disease can, indeed, hardly be overpraised. They were injected with blood from patients dying from yellow fever; they were bitten by infected mosquitos; they slept in beds in which patients had died; and they wore infected clothes. We referred more than once last year to the progress that is being made in the prophylaxis of yellow fever, and a review of what has already been achieved by Hindle and others was given in a leading article on November 24th (p. 947).

ANNUAL MEETING OF THE CANADIAN MEDICAL ASSOCIATION.

THE annual meeting of the Canadian Medical Association is being held this year at Montreal from June 17th to 21st. Among the principal speakers are: Professor E. Rist of Paris, who will give a lecture on the onset of pulmonary tuberculosis and its lobar localizations; Mr. J. A. Cairns-Forsyth of London, who will lecture on the surgery of the biliary tract and pancreas; Sir StClair Thomson, who will speak on intrinsic cancer of the larynx and its successful treatment by laryngo-fissure; Dr. D. P. Armand-Delille of Paris, who will demonstrate the diagnosis of the early stages of pulmonary tuberculosis in infancy and childhood, by means of x-ray films, anatomical preparations, and coloured lantern slides; Professor L. Ambard of Strasbourg, who will lecture on the significance of hyperglycaemia in diabetes; and Dr. G. B. Roatta of Florence, who will deal with child welfare as the basis of public health. Other subjects for consideration at this meeting are: the differential diagnosis of clinical conditions accompanied by jaundice; periodic health examination; acidosis in anaesthesia; and the duty of the doctor to the hospital. The Harvey film will be shown by Dr. Léo Parizeau of Montreal. A report on B.C.G. vaccine will be rendered by Dr. J. A. Baudouin of Montreal. In addition to these general sessions there will be sectional meetings occupying three mornings. Thursday, June 20th, will be celebrated as "Osler Day," and the Osler Memorial Address will be inaugurated. The April issue of the *Canadian Medical Association Journal* contains further details about this annual meeting, and also an historical sketch of Montreal.

THE KING, as patron of the London Radium Institute, has approved the appointment of Sir George Blacker, M.D., as president of the Institute in place of the late Sir Anthony Bowlby, and of Sir Hugh Rigby, F.R.C.S., as a member of the committee.

THE President of the Victorian Branch informs us that a meeting will be held by that Branch on May 12th as a memorial to Sir George Syme, LL.D., F.R.C.S., Vice-President of the British Medical Association, of whom an obituary notice appeared in our last issue.

IT is announced that the first congress of the International Society for Microbiology, which was fixed to take place in Paris in October, 1929, has been definitely postponed to June 25th, 1930. The programme, which has already been published in various scientific journals, will stand.

Two popular lectures will be delivered next week in the Great Hall of the British Medical Association House, Tavistock Square, in connexion with the Fifth International Congress of Military Medicine and Pharmacy. They are open to any member of the British Medical Association, and the Executive Committee of the Congress hopes to welcome many medical practitioners and ladies accompanying them. The first lecture will be by Major Ian Hay Beith (Ian Hay) on the subject of "The English sense of humour." It will be delivered at 3.30 p.m. on Tuesday, May 7th, the chair being taken by Surgeon Vice-Admiral Arthur Gaskell, Medical Director-General, R.N. The second lecture, at 3.30 p.m. on Thursday, May 9th, will be by Sir Philip Gibbs, on "Experiences of an official war correspondent." Those attending the lectures will be welcomed also at the Service and Commercial Exhibition which is being organized in the extension of the B.M.A. House during the week of the Congress.

BRITISH CONGRESS OF OBSTETRICS AND GYNAECOLOGY.

DISCUSSION ON THE MANAGEMENT OF CASES OF PELVIC DISPROPORTION.

THE seventh British Congress of Obstetrics and Gynaecology met in the Royal College of Physicians, Dublin, on April 24th, 25th, and 26th; Dr. GIBBON FITZGIBBON presided. The opening subject was the management of cases of pelvic disproportion, and the discussion was introduced by Professor MUNRO KERR (Glasgow), who dealt with the diagnosis of this condition.

Professor Munro Kerr pointed out that the diagnosis of pelvic disproportion by instruments, the hands, or radiography was very difficult in so far as the obtaining of exact measurements of the pelvic inlet was concerned, but that deformities of the outlet could be accurately determined. He insisted that the selection of treatment for deformity of the pelvis at the inlet depended on an exact estimation of the relative size of the foetal head and the pelvis, but, for the outlet, treatment should be based on exact measurement of the outlet. He emphasized the importance of recognizing minor deformities, since failure to do so resulted so often in unsuitable treatment being employed; he believed that the largest proportion of disasters occurred in this group. In conclusion, he pointed out that the practical question was: Will the head pass? He referred to the factors which influenced spontaneous delivery: (1) the previous obstetric history; (2) any irregularity in the pelvic brim; (3) the size of the foetal head; (4) the degree of ossification; (5) the variety of biparietal obliquity; and (6) the strength of the uterine contractions.

Professor FLETCHER SHAW (Manchester) dealt with the immediate results to the mother and the child of labour with contracted pelvis. He showed clearly that induction, even though it must be performed unnecessarily in many cases, was still a potent factor in reducing the large number of Caesarean sections.

Dr. JAMES YOUNG (Edinburgh), speaking on the treatment of obstructed labour due to pelvic disproportion, brought to the notice of the meeting the importance of inter-hospital investigation of the mortality and morbidity in institutions where the same lines of treatment were being employed. In one instance which had come under his notice, one hospital, in a series of Caesarean sections performed on clean cases, had a mortality six times greater than another hospital using the same technique. He cited the great record of Frances Ivens in this respect, and suggested that the discrepancy between any two institutions, when all other sources of infection had been excluded, was one endemic to the particular hospital concerned.

Dr. J. D. BARRIS (London) dealt briefly with the history of the operation of induction, and clearly indicated the value of this method of treating disproportion, provided that a time after the thirty-sixth week was chosen.

Dr. R. H. PARAMORE recommended pubiotomy in neglected contracted pelvis cases. In such cases, in which delivery with forceps had been tried perhaps often, and many vaginal examinations had been made, if pubiotomy was discarded one must either perform Caesarean section, with what seemed a very considerable risk to the mother, or a craniotomy, at times on the living and uninjured child. In these cases pubiotomy was a valuable and useful procedure. He had performed the operation seven times; he had had one death from pre-eclampsia, and one case of urinary incontinence due to ulceration of the urethra. The death was in nowise connected with the operation; the urinary trouble in the other seemed to be due to the use of a retained catheter, but the case had been very difficult to nurse; all the other patients had recovered. A point to be noticed, which was not mentioned in the books, was that the vagina might be split, during the delivery, opposite the section of the bone. In septic cases an osteo-myelitis could develop, and this happened in one of the speaker's cases. In another case pubiotomy resulted in a living child, and convalescence was normal.

Dr. W. R. MACKENZIE (Belfast) said that while external pelvimetry enabled them to measure directly external pelvic diameters, and thence to draw certain conclusions as to the degree of contraction, it was insufficient for estimating the size of the pelvic cavity. This could not be done directly in the living woman except during a laparotomy. Internal pelvimetry had the disadvantage that an anaesthetic was required for accuracy, and even then more than one finding was necessary. The only accurate method was that of æ-ray photography, with a standard pelvic photograph as introduced by him in 1923. By this method one could accurately measure the pelvic inlet and outlet. The minor degrees of contraction were easily recognized, and one could advise the patient when a test of labour or induction should be attempted.

Dr. BETHEL SOLOMONS and Dr. W. TAYLOR (Dublin) discussed 294 cases encountered at the Rotunda Hospital during a period of two years. The various methods by which diagnosis was made ante-natally were considered; the value of external pelvimetry was dealt with, and its relation to the size of the foetal head. Other points for discussion were: should the Skutsch pelvimeter be used, and would it, with æ-ray pelvimetry, replace this method? A modification of the external Müller procedure was suggested and illustrated. The Kerr-Müller procedure must be carried out as a routine; its technique was considered. Treatment would depend largely on the findings of this examination, and successful results could only be obtained after experience. Some points in a trial labour were emphasized; in connexion with this the details of making a rectal examination were of importance. The fact that a woman had been delivered of one or two infants normally did not exclude the possibility of difficulty in subsequent confinements. Were there indications for pubiotomy? Disproportion might be caused by factors other than the relation of head to pelvis; inco-ordinate uterine action was a typical example. Examples of this abnormality were given and the question was discussed. At the end of the paper a summary of the varieties of contracted pelvis encountered in the investigation was given. The conclusions reached were as follows. There were 294 cases that could be grouped as disproportion among 4,000 progressive cases at the Rotunda Hospital over two years, a percentage disproportion rate of 7. Ante-natal diagnosis was the ideal to aim at; the possible course of labour could be surmised thus in many cases. External pelvimetry was of much service; 43.8 per cent. of the cases with small measurements in the series required some form of operative intervention. Internal pelvimetry by the Skutsch instrument was used; the measurements obtained were of distinct service in estimating the probable margin of safety on the side of proportions in conducting a trial labour. X-ray pelvimetry was useful, and should prove to be more so. It avoided internal manipulation, and gave accurate results in a large percentage of cases. An æ-ray film provided a fair idea of relation of head to pelvis. The head was the best pelvimeter. The suggested modification of the Müller method was extremely useful. The Munro Kerr-Müller estimation must always be made; in this the importance of the soft parts must be remembered. Induction of labour had an important place in their treatment, but the knowledge when to induce and when to leave alone required prolonged practice. Induction and trial labour might be employed in borderline cases, with a view to the performance of the lower segment section operation with safety. Rectal examination should be used to watch the progress of labour, but there was no need to overdo it; one vaginal examination was usually sufficient. When uterine inertia occurred great care must be exercised in diagnosing whether the condition was primary or secondary. The condition of the foetal heart must be observed; temporary accelerations or diminutions were not always of great importance. Information of note could often be obtained by observing the height of the retraction level; this gave a relative idea of the size of the cervix and of the amount of tension in the lower segment. Since failure to deliver with the forceps had been common in some countries in the past, the authors gave their points in diagnosis regarding pubiotomy, in the belief that the failures referred to had been due to faulty diagnosis. They believed that pubiotomy had a very small place in treatment. A final Munro Kerr-Müller examination should be made under anaesthesia in cases in which

there were indications for delivery, but it was not possible to be absolutely certain without anaesthesia that the head had passed through the brim. It was suggested that an investigation into the comparative weights of mothers and newborn babies might be made. The symptoms and signs of dystocia were given. The diagnosis of false labour, spasm of the uterus, and especially contraction ring must be thought of when dealing with any case of disproportion. A group of symptoms found in cases of contraction ring was given.

Professor R. W. JOHNSTONE (Edinburgh), in a paper on the induction of premature labour in disproportion, dealt most lucidly with the points for and against the procedure, citing the experience and dicta of various schools. He stated that it was his feeling that the place of induction was in those cases of disproportion where there was just an element of doubt whether a full-sized child would pass through the pelvis without subjecting itself and the mother to a prolonged and difficult labour. This was especially the case in primigravidae, for the information so gained would be of the first importance in subsequent labours. Professor Johnstone believed that the operation was justified in the case of a woman who, in a previous labour, had been delivered naturally of a stillborn child of average or over average weight, or in whom the test of labour on a previous occasion had failed and necessitated a high forceps operation. Cases of slight contraction of the outlet also came within the category of this suitability.

Mr. EARDLEY HOLLAND said that the results of treatment of cases of slight and moderate disproportion by the induction of premature labour were, up to a point, very good; the maternal mortality was almost zero, the foetal and neo-natal mortality was not more than 10 or 12 per cent., and the later infant mortality was said to be not too high. The alternative method of treatment by the "test of labour" had never found favour in Great Britain, but was employed in almost every other country. Treatment by induction of premature labour did not require a high degree of obstetrical skill or experience; but treatment by the "test labour" method was suitable only for expert obstetricians. It was essential to have an experienced and expert obstetrician resident in the hospital; every phase of a "test labour" must be watched by an expert, who must know exactly when and how to intervene. Mr. Holland had become dissatisfied with the induction method many years ago. Apart from the high foetal and infant mortality associated with its then methods of inducing labour left much to be desired. They were slow, uncertain, and often required many operations; the character of the resulting labour was often unsatisfactory; in a high proportion of induced labours there was uterine inertia and early rupture of the membranes, with the common sequels of malrotated vertex presentations and badly flexed heads. His experience led him to continue using the "test labour" method. In an investigation undertaken in 1926, the results of which were embodied in a paper read at the Coombe Hospital Centenary Congress, he had come to the conclusion that induction had been performed unnecessarily in 89 per cent. of the cases, and had been performed either too early or too late in many of the remainder. Cases of apparent disproportion at the thirty-sixth or thirty-seventh week might by the time term was reached be found with the head well engaged in the pelvis. Mr. Holland concluded by emphasizing the value of the "trial labour," when properly conducted by an expert.

Dr. BETHEL SOLOMONS, replying, said that the main purpose of the teaching at the Rotunda was that the general practitioner should acquire knowledge which would ensure a safe delivery for his patients. He practically never performed section before labour, unless in repeat cases with absolute indications. The lower segment operation was safer than the classical. There was scarcely any mortality, and the morbidity was small: it could be employed after trial forceps or failed forceps. Drainage should be used in suspicious cases. The papers read that day had established the superiority of the low over the high incision, especially with regard to the number of fatalities in potentially septic cases. He intended to give trial labours to suitable patients on whom the lower segment operation had been performed. There had been one incomplete rupture of a scar; the patient had previously had an 8-lb. baby, and the measurements were normal. On the subsequent occasion the child was over 10 lb., and foetal distress necessitated delivery; the uterine muscle had ruptured for about an inch, the membranes and the peritoneum were intact. Both mother and child had uneventful recoveries. There had been several normal deliveries after previous section. There was never any necessity for craniotomy on the live child; the lower segment operation was as safe, if not safer, in suspicious cases where marked disproportion existed. In some cases, even when the child was dead, section might be indicated. He did not agree that previous stillbirths made Caesarean section absolutely necessary, unless the woman was near the completion of the child-bearing age. It must be clearly remembered that most of the cases reported by Holland were before the popularity of the lower segment operation became manifest. The longer that labour lasted the greater was the bacterial content of the uterus. When the results of induction and section were compared the number of unnecessary sections must be taken into account. He, Dr. Solomons, was a firm believer in induction, in trial labour, and in induction followed by trial labour; they all had their place. There was a very small field for induction in primigravidae, but this treatment certainly had a place in obstetrics. He joined in the protest against the separation of the ante-natal clinic from the maternity hospital. The establishment of such isolated clinics was a waste of public money, which could be spent much better on increased grants to the hospitals. Trial labour could be practised in private practice. He thought it was a great credit to the congress, and to British and Irish obstetricians in particular, that the Kielland forceps had not been mentioned by any speaker in the discussion; the instrument was dangerous.

(To be continued.)

ZOOLOGICAL SOCIETY CENTENARY.

THE centenary celebration of the Zoological Society of London took place in the Great Hall of University College on April 29th. The president of the society, the Duke of Bedford, occupied the chair, and congratulatory addresses were presented by the representatives of learned societies in seven countries. Among those on the platform were the French and Italian Ambassadors, a representative of the German Ambassador, Viscount Grey, the Earl of Onslow, Sir Ernest Rutherford, President of the Royal Society, and representatives of many scientific bodies.

Historical Surveys.

The DUKE OF BEDFORD gave a brief account of the history of the society from the more popular side—that is, the development of the gardens and the menagerie—leaving it to Dr. P. Chalmers Mitchell, the secretary, to speak of scientific achievements. He mentioned as one example of the forward look of the society that as far back as 1829 it made women equally eligible with men as Fellows; in fact, the senior Fellow of the society at the present moment was a lady, elected in 1865. Each sovereign in turn, from George IV onwards, had been a patron of the society and had enriched its collection with gifts. It was an encouraging fact that at this one hundredth annual meeting it should be possible to report that the number of visitors to the gardens last year (2,225,000) and the present number of Fellows (8,067) should both be at high-water mark.

Dr. CHALMERS MITCHELL then followed with some description of the society's scientific work. He mentioned that the first list of items in the collection a hundred years ago included 43 species of mammals, 93 of birds, and one of reptiles; the centenary list comprised 949 species of mammals, 2,330 of birds, and 1,174 of reptiles, amphibia, and fishes. The society had also introduced to science, by inadvertence rather than design, many new and curious subjects of the animal kingdom, comprising a greater number of species than all the animals legitimately in the gardens. These were the external and internal parasites—inhabitants of skin [illegible] ther, of intestinal tract, blood, and internal or[illegible]als. The imp[illegible] tance of these parasites was [illegible] be understood,

and although they had been collected and named intermittently throughout the history of the society, it was only during the last dozen years, under the direction of Professor Leiper, that they had been systematically studied, the study adding greatly to scientific knowledge. A large part of the usefulness of animals to science, Dr. Mitchell continued, began after their death, and the bodies of the society's animals had furnished valuable material for the study of comparative anatomy. He mentioned some famous anatomists and physiologists of the past who had worked in connexion with the gardens, among them Thomas Bell, Huxley, and Victor Horsley. Among living men of eminence in this field, Sir Arthur Keith, Professor Elliot Smith, and Sir John Bland-Sutton had all acknowledged their indebtedness to the prosectorium. It was largely owing to the influence of Huxley that the prosectorium was established, and the prosectorship had been filled by a succession of men of great ability. Pathological investigation into the cause of death was an integral part of Huxley's scheme, and although it faded out for a time, in 1903 pathology was restored to its proper place, and a pathological post added to the prosectorium; this post also had secured brilliant occupants. After touching on the way in which the society had advanced zoological knowledge in consequence of its publications, Dr. Mitchell mentioned that at one time it maintained a museum which kept systemic zoology alive during the "dark ages of Bloomsbury," before the renascence came with the setting up of the Natural History Museum at South Kensington. In recent times he claimed that the society had done much to advance animal physiology; he knew that the mention of "physiology" opened the floodgates of apprehension, but physiology had no specific relation to laboratory research. It implied simply observation of the habits of living animals, breeding, acclimatization, and the investigation of hygiene in its widest sense. The relations of animals to their environment had been studied, especially as regards fresh air, heat, light, and food. Some of the work carried out was pioneer experiment based on the investigation of animal physiology, and here he thanked Dr. Leonard Hill, of the Medical Research Council, for invaluable assistance in the effort to apply correct physiology to the welfare of animals.

Congratulatory Addresses.

Addresses of congratulation were then presented. Sir CHARLES SHERRINGTON for the Royal Society, spoke of the long and honorable record of the Zoological Society in the promotion of research and exploration. The society combined, as few scientific societies could combine, the pursuit of science with popular interest, and what greater proof of popularity could there be than to bring about a distortion of the language, as in the word "zoo." He found the gardens an admirable place for the exercise of that supremely human prerogative—contemplative curiosity. M. CHARLES GRAVIER brought the felicitations of the Académie des Sciences and the sister institution of France. Mr. H. H. DRUCKHOFF, representing the German Zoological Society, spoke in grateful terms of the help which British zoologists had afforded in establishing the many collections in German cities. Dr. CASEY WOOD conveyed the greetings of the Smithsonian Institution at Washington, reminding the company that that institution owed its foundation and endowment to an English chemist who never saw America. In trying to carry out James Smithson's ideals the institution had taken pattern by the Zoological Society, though without its unrivalled opportunities for obtaining specimens. Dr. JORDAN, from the Royal Academy of Sciences, Amsterdam, made a plea for scientific internationalism. Professor COSMO EWART brought the greetings of the Royal Society of Edinburgh, while having to acknowledge that there was very little to be said about zoological work at present in Scotland; and, finally, Professor A. F. DIXON, representing the Royal Irish Academy and the Zoological Society of Dublin, expressed the thanks of the latter body for much valuable co-operation.

Sir JOHN BLAND SUTTON, in proposing a vote of thanks to the president, made some characteristically whimsical remarks about the antiquity of zoological science. Eden, he said, was the first zoological garden, and Adam, the keeper, had the privilege of naming the animals without being embarrassed by priority in nomenclature. The first travelling menagerie was undoubtedly that of Noah, whose ability to get the animals to go two and two into the ark must have been the envy of every superintendent and keeper since. Zoology was studied to-day as a part of natural history, also for comparative anatomy, and in relation to pathology, even human pathology. From the beginning of its existence the society had been hampered by its environment, but now it had acquired a valuable zoological park at Whipsnade in Bedfordshire, where observations—he did not like to use the word "experiments"—would be carried out likely to throw a good deal of light still upon the origin of species, and particularly in regard to the infertility of hybrids, which had never yet been explained.

Dinner at the Zoological Gardens.

The formal oratory of the celebration was confined to the afternoon gathering, but a private dinner party was held in the evening at the society's gardens in Regent's Park, when the Duke of Bedford presided over a very distinguished company, which included H.R.H. the Prince of Wales. Among prominent representatives of medicine who accepted invitations to the dinner were the following:

Sir John Rose Bradford (President, Royal College of Physicians), Dr. H. H. Dale, Dr. F. G. Dawtrey Drewitt, Sir Walter Fletcher, Sir Archibald Garrod, Lieut.-Col. A. E. Hamerton, Professor Leonard Hill, Sir Arthur Keith, Professor R. T. Leiper, Dr. G. C. Low, Mr. V. Warren Low (representing the President, Royal College of Surgeons), Mr. P. H. Mitchiner, Dr. S. Monckton Copeman, Professor F. G. Parsons, Dr. Charles Porter (M.O.H., Marylebone), Sir David Prain, Sir Charles Sherrington, Dr. G. Sowden (M.O.H., St. Pancras), Sir John Bland-Sutton, Dr. G. M. Vevers, Dr. C. M. Wenyon, Professor William Wright, and the Editors of the *Lancet* and the *British Medical Journal*.

Union of South Africa.

[FROM OUR CORRESPONDENT IN PRETORIA.]

Radium.

THE Federal Council of the Medical Association of South Africa (B.M.A.) has on more than one occasion recently drawn attention to the desirability in the public interest of a supply of radium which shall be available for the use of such hospitals in the Union as possess the services of competent radiologists. The public imagination has been stirred, perhaps to an unwarranted extent, by the therapeutic possibilities of radium. Difficulties have, however, arisen owing to the cumbersome organization of medical services. Appeals made to the central Government have been referred to the provincial administrations which are responsible for the provision of hospital supplies. The provincial administrations point out that the matter is one to be dealt with by the individual hospital boards, and that they have to wait on these boards to put up the case for the provision of radium. The sympathetic interest of some of the provincial Governments has, however, been aroused. In the Cape Provincial Council on March 25th, the Kimberley member drew attention to the many millions of pounds being spent in the Union on cattle diseases, the destruction of locusts and vermin, and on the eradication of noxious weeds. In view of funds being so readily available for these purposes, he asked if the administrator would not approach the Union Government in the cause of suffering humanity with the object of obtaining not less than £25,000 for the purchase of radium for the principal hospitals of the Union? Failing this, would the administrator place a similar sum on the current year's estimates of the Provincial Council for the purpose? The administrator, Mr. Fourie, replied that investigations into the efficacy of radium treatment were being instituted, and the request of the Kimberley member would be considered when the inquiries were complete. A hospital radium fund is in existence in Johannesburg to which sums have been privately contributed. Recently the sum of £10 was presented to it by the Johannesburg Clinical and Pathological Club.

Further Plague Cases.

Plague continues to spread in waves among the veld rodents, and periodically a crop of human cases is announced in an area containing infected rodents. On March 22nd the Minister for Public Health made an official announcement as to the position. During January an active recrudescence of plague in veld rodents commenced in the northern portion of the Orange Free State, spreading eastward and northward from there. In the affected area eight human cases, including one European,

occurred. During February there were two further cases, both in natives. Field surveys carried out by the Union Health Department and the Johannesburg municipality showed that the infection in veld rodents had spread to the little village of Meyerton and the southern boundary of the Germiston municipality, both of which areas abut on the Johannesburg municipal area. During the present month fifteen native cases with fourteen deaths have occurred in the area immediately south of the Vaal River. Dr. Hauptfleisch, district surgeon of Parys, who had been actively engaged in the work in this area, also became infected, and had to be removed to the *Bietfontein Hospital* for Formidable Epidemic Diseases. The Minister's announcement that Dr. Hauptfleisch was making good progress was greeted with applause. The Union Health Department has established a field hospital south of the Vaal River. On March 21st an itinerant native was found sick of plague north of the Vaal River, but this is the only case so far reported on the Johannesburg side of the river. Conferences have been held between officers of the Department of Health and those of the Johannesburg and other Reef municipalities. All of these bodies are actively co-operating to prevent further spread. The chief danger continues to be the extension of infection from veld rodents to town rodents. A great deal has, however, been done by most of the Reef municipalities during the past three years to exclude rats by the rat-proofing of all buildings where material attractive to rodents is stored. Rat-free zones round the urban areas have also been maintained.

Mass Thermometry.

The medical supervision of large groups of natives employed on the gold and coal mines of the Transvaal involves many practical difficulties. At present the only examination made periodically on all the native employees is the determination of their weight. These weighings are generally carried out by a lay hospital superintendent. Individuals with even slight loss of weight are then picked out for detailed clinical examination by the mine medical officer. Loss of weight is of very obvious significance to a medical officer who is continually on the alert for incipient phthisis. Sir Spencer Lister, director of the South African *Institute for Medical Research*, has now devised a method for ascertaining the body temperatures of these workers in bulk. By this method it will be possible rapidly to pick out for further clinical examination any individuals with abnormal temperatures. This may prove a useful adjunct to the present system of periodic weighing for the detection of tuberculosis. Instruments are already in use for recording continuous temperatures in human subjects for experimental purposes, but this is apparently the first time that the principle involved in such instruments has been adapted for mass clinical purposes. The experiments for determining the best means of putting into effect the principle that Sir Spencer Lister has devised were carried out by Professor A. V. Hill of London, and the apparatus was put together by two of his assistants, Messrs. J. C. Parkinson and A. C. Downing. The apparatus at present used consists of fifteen thermo-couples, a dead-beat moving-coil galvanometer with a reflecting mirror which is interposed in the electric circuit, a thermostat, a switchboard connecting the fifteen thermo-couples with the galvanometer in such a way that each thermo-couple can be placed independently in circuit with it by turning over its corresponding switch, a calibrated scale upon which are recorded the movements of the light spot reflected from the mirror attached to the moving coil of the galvanometer, and a suitable electric lamp for the illumination of the mirror on the coil of the galvanometer. By means of this apparatus obvious variations from the normal temperature can quickly be detected among individuals of large groups of persons. The apparatus, which Sir Spencer has willingly demonstrated to various interested persons, enables fifteen individuals each to place simultaneously the hot junction of one thermo-couple beneath the tongue or in the axilla. When any one switch is closed the moving coil is deflected, the deflection being recorded by the movement of a spot of light on the calibrated side. With the switch open—that is, with no thermo-electric current flowing—the light spot takes up a position at an arranged zero point on the scale. Sir Spencer suggests that this principle of rapid clinical thermo-electric thermometry may find useful application in large hospitals, saving much of the time and labour involved in the present use of maximum clinical thermometers. If it could be made more compact and portable it would be invaluable to port health officers, who are frequently called upon to take the temperature of passengers and crews of large steamships.

India.

Transmission of Plague by X. cheopis.

IN a leading article on the international control of plague (February 2nd, p. 213) it was suggested that the reports collected on behalf of the International Health Office, and introduced by Professor Ricardo Jorge, while leaving little doubt that the rat-flea, *Xenopsylla cheopis*, is the most important transmitting agent, fail to settle the vexed question of the part played by *X. astia*. We noted that, though the work in Ceylon of Dr. L. F. Hirst, city microbiologist to the Public Health Department of Colombo, would seem to acquit *X. astia* of serious harm, Graham and Mital, reporting from India, gave data which were difficult to reconcile with that flea's innocence. We have now received from Dr. Hirst the following additional information.

The results of a rat-flea survey of such an area as the United Provinces are not comparable epidemiologically with my findings in the lowlands of Ceylon. The climate of the United Provinces is characterized by violent seasonal fluctuations in atmospheric temperature and humidity, and there are corresponding variations in gross rat-flea prevalence from about two per *R. rattus* during the height of the hot season to about twenty during the season most favourable to rat-flea reproduction. *X. astia* and *X. cheopis* are both indigenous to the Indo-Gangetic plains, and *X. cheopis* is present in sufficient numbers for plague propagation. The climate of low-country Ceylon is, on the other hand, equable and humid, the mean temperature is very near the upper limit favourable for plague transmission by *X. cheopis*, and the gross flea index averages from 2 to 4. So far *X. astia* alone has been found in the plague-immune lowlands of Ceylon outside Colombo. *X. cheopis* is a foreign invader imported with grain and other forms of merchandise; its distribution and prevalence in Colombo are closely correlated with human and rat plague. Plague is endemic only in that small area near the harbour where *X. cheopis* is relatively numerous; the importation of small numbers of *X. cheopis* into an *X. astia* area has frequently been followed by sporadic outbreaks of plague, which, however, have shown no tendency to spread.

In the lowlands of Ceylon, with their relatively stable rat-flea population, the percentage of *X. cheopis* among the various local collections of rat-fleas may be correlated with the corresponding local incidence of plague, though even here, from a strictly biometric point of view, it is much sounder to adopt the *X. cheopis* index (average number of *X. cheopis* per rat) as the criterion of flea prevalence. I am well aware of the theoretical objections to using specific flea indices as a comparative measure of flea population, but maintain that the method is adequate for the purpose in view. The Colombo data as set forth in my memoir[1] on researches on the parasitology of plague have been submitted to Professor M. Greenwood, who finds "no substantial ground for statistical criticism."

In the United Provinces crude percentages of *X. astia* and *X. cheopis* in local collections of rat-fleas cannot legitimately be correlated with the corresponding variations in plague incidence. The curves of *X. cheopis* and *X. astia* seasonal percentage variation shown in Dunn and Mital's original report fail to represent correctly the real fluctuations in the flea population of the respective species. I have criticized their flea survey technique in the above-mentioned memoir. The original report of the results of the United Provinces survey contains the following comment by Lieutenant-Colonel J. Taylor, I.M.S., formerly a member of the commission for the investigation of plague in India: "The report would be much more valuable if the average number of fleas per rat had been recorded monthly, and as it stands it is not possible to say what the maximum prevalence of such species may be. The flea curves have been found of the greatest value by the plague commission in relation to the seasonal prevalence of plague and to some extent to severity of outbreaks and likelihood of epidemic plague." I heartily concur, but would it not have been better to publish these criticisms in the *Bulletin* of the International Health Office?

[1] Published in Colombo, 1927.

Curves showing the seasonal prevalence of all species of fleas in such localities as Lucknow, Cawnpore, and Banca can be constructed from the data contained in the report by Norman White and Gloster on the epidemiology of plague in the United Provinces. Unfortunately Rothschild[1] had not published his paper on the Indian *Xenopsylla* at the time when these observations were made. *X. cheopis*, *X. astia*, and *X. brasiliensis* were not distinguished as separate species in any of the reports of the Indian Plague Commission; all *Xenopsylla* were identified as *cheopis*. When the percentage figures for these localities given by Dunn and Mital are converted, with the aid of the gross flea-index data supplied by White and Gloster, into specific flea indices, it is seen that the curve of *cheopis* prevalence fits that of plague seasonal incidence more closely than does the *astia* curve. Dunn and Mital would have done better to complete the preliminary rat-flea survey of the United Provinces begun by Cragg in 1921, using as the criterion the percentage number of *X. cheopis* and *X. astia* during the plague season, and then, taking into account all the relevant factors, concentrate on the study of the relation between seasonal prevalence of rat-fleas and of plague in carefully selected areas.

The northern plains of India are, as a whole, unsuitable for the investigation of the relationship between *X. astia* dominance and regional immunity to plague. Towards the south-west of the Punjab the relative immunity is probably due rather to the effect of an intensely hot, dry climate on the survival of infected rat-fleas than to *X. astia* predominance; in part of Bengal it may be attributed to scarcity of rats, and lack of communication with infected areas.

Until we know more of the factors which influence the relative transmitting power of flea species in a state of nature the results of transmission experiments under artificial conditions cannot lead to definite conclusions. Attention may, however, be drawn to the findings of Armath Govle[2] in Lucknow, which confirm the conclusion based on my Colombo experiments that under tropical conditions *X. astia* is inferior to *X. cheopis* as a transmitter of plague.

Dr. Hirst adds that he has just completed a fresh rat-flea survey of Colombo, supplemented by observations in hill and low-country Ceylon. He thinks that there is a slight but definite extension of the *cheopis* areas, and therefore of the potential zones of plague endemicity. He suggests that a similar slow process of *cheopis* infiltration of originally pure *astia* territory is taking place in several parts of India as a result of commercial intercourse with *cheopis*-infested stations, and remarks that if this is the case the relative immunity from plague hitherto enjoyed by the inhabitants of the *astia* zones is doomed to disappear.

Preventive Medicine in Assam.

Two striking instances of the value of prophylactic medical measures are given by Lieut.-Colonel T. D. Murison, director of public health in Assam, in his report for the year 1927. Although the problem of the transmission of kala-azar remains unsolved, there is thought to be a reasonable possibility of eradicating this infection, provided that the campaign against it is pressed in the future with no less energy than is the case at present. In June, 1927, universal or mass treatment of all kala-azar patients with urea stibamine was instituted consequent on a marked reduction having been effected in the cost of this preparation; previously only 10 per cent. of the patients had been so treated, the remainder having received the less effective sodium antimony tartrate. The change of treatment resulted at once in a most gratifying increase of cures and a more regular attendance of patients at treatment centres. In a certain district, for example, a survey of villages served by one dispensary was conducted, all persons suspected of kala-azar infection were examined, and treatment was started at once when the disease was detected. Prompt improvement in the incidence of infection followed, and, later on, after another very careful survey, it was found possible to close the dispensary. This active searching for disease is carried on wherever kala-azar appears or is suspected, and the results are most promising. In some districts such surveys are of vital importance, since the patients live far from the hospitals and few come forward voluntarily for treatment; but for this careful investigation numerous cases would be overlooked and serve as foci of infection. The great danger in the future appears to be that these efforts may be relaxed in view of the lessened incidence of outbreaks, and a serious warning was given by Major H. E. Shortt, I.M.S., director of the Kala-azar Commission, to members of the Health Interchange of the League of Nations, who visited Assam early in January, 1928. Within another two or three years, he said, kala-azar would probably have reached again the comparatively low level of the inter-epidemic periods. During the progress of an epidemic it was quite easy to raise large sums of money and to excite public interest in measures of treatment and prevention, and, therefore, full advantage should be taken of the existing public interest during the next year or two, so that the few remaining embers of infection left behind as the result of the present epidemic might be extinguished. Major Shortt added that this was the first occasion on which any effective treatment had been available for kala-azar, and that therefore the next few years were likely to be highly critical in view of the fact that if intensive measures were continued they would have a more far-reaching effect than had ever been possible before. In another part of Lieut.-Colonel Murison's report attention is called to the rise in the cholera mortality in Assam during 1927, as in other parts of India. As the result, however, of mass inoculation with anticholera vaccine being undertaken, the death rate had been considerably lower than could have been anticipated. At first it was thought that the spread of the infection was due to infected milk, and certain preventive measures were adopted, but this view was subsequently found to be erroneous, and, eventually, the infection was traced definitely to the water supply. Immediately on the receipt of notification of a case of cholera, disinfection of wells in the area and inoculation of contacts were secured, guards being placed over the wells, and care being taken to supply only uncontaminated water to the inhabitants of infected localities. The epidemic was quickly brought under control, though a temporary isolation hospital had to be erected in one district. Elsewhere numerous outbreaks were quickly suppressed by these preventive measures, though in one case delay in notification allowed the disease to get a firm foothold for a short time. The increased success which rewarded these efforts in 1927 is attributed to the use of inoculation on a large scale.

Ireland.

Enteric Fever in Leitrim.

DR. P. MCDONNELL, medical inspector, Department of Local Government and Public Health, attributes the recent epidemic of typhoid fever in Carrick-on-Shannon, which resulted in some deaths, to the water supply and the want of sanitary organization. Dr. McDonnell, in a report addressed to the Leitrim Board of Health, traces the outbreak to the water supply, the infection having been introduced through the defective methods of disposing of the sewage from Carrick-on-Shannon fever hospital, coupled with the faulty condition and surroundings of the pipe line by which the town water is conveyed to the pumping station and the reservoir. He went to Carrick-on-Shannon on the report of the medical officer of health that there was a severe local epidemic of influenza with typhoid symptoms. Influenza had been prevalent, and those who recovered were stricken down in four or five days with what was at first believed to be a relapse of influenza. A patient sent to Roscommon Infirmary was found to be suffering from enteric fever, and this appeared to be the first indication of the presence of a typhoid infection. Dr. Walsh, the local medical officer of health, was amongst the patients, and Dr. McDonnell visited several cases, accompanied by Drs. McDermott and Doorly, and Professor Meenan, professor of medicine in the National University of Ireland. After examining five or six cases they concluded that they were dealing with an outbreak of enteric fever. Discussing the origin of the outbreak, Dr. McDonnell says that the water supply is taken from the River Shannon by a pipe not more than fifteen feet from an open drain, which is the channel through which the fever hospital sewage passes.

Holes and defects in the pipe line, and excavations made for leakages, he believes, would give direct connexion with the sewage in the drain. From January 9th to March 14th eight typhoid cases from Ballinamore were treated in the fever hospital. The disposal of the fever hospital sewage constituted a disgustingly foul cesspool. The overflow passed through a network of drains, which finally emptied themselves in the Shannon parallel to the intake of the water supply. Dr. McDonnell suggests the steps that should be taken to remedy the defects in the water supply, and recommends a new source of supply from Corbally Lake, because as long as the people are depending upon the Shannon for their water supply they will be in danger of an epidemic. The village of Leitrim is only four miles from Carrick-on-Shannon, and the occurrence of even one case of enteric in this village would be a serious menace to the health of the people of Carrick-on-Shannon. Dr. McDonnell adds that if the county had the services of a county medical officer of health with a trained sanitary staff this outbreak could not have occurred, and the prevailing conditions in Carrick-on-Shannon would not have been permitted to exist for twenty-four hours. He regards the employment of untrained sanitary officers as one of the gravest defects in the county organization, and draws attention to the neglect on the part of medical practitioners to fulfil their statutory obligation of notifying infectious diseases. The Board of Health decided to expend at once £500 to remove the sources of pollution of the water, and to increase the supply. They further decided to ask the Local Government Department for a grant in aid in view of the loss sustained.

Montgomery Lecture in Ophthalmology.

Mr. Louis E. J. Werner, M.B., D.O.M.S., the Montgomery lecturer for 1929, delivered an address on "The slit-lamp in clinical practice," before a large audience in the Physiological Laboratory of Trinity College, Dublin, on April 25th. The lecturer first described the mechanism and means of employment of the slit-lamp, and then dealt in detail with its use in both diagnosis and prognosis. He insisted on the fact that the slit-lamp was no mere clinical toy, but that it yielded important information which could not be obtained by any other available means. He himself had found it of much value in distinguishing between optic neuritis due to intracranial pressure and optic neuritis of inflammatory or toxic origin. In the former group of cases little or no change was found in the vitreous, while in the latter group extensive cellular infiltration of the vitreous was constantly noted. He had also found it of great use in cataract cases, more particularly by enabling him to distinguish the type of early case in which immediate operation was advisable from the type in which delay should be recommended. Many illustrative cases were quoted to demonstrate points in connexion with the use of the lamp in corneal disease, diseases of the anterior chamber, and diseases of the ciliary body. The lecture was illustrated throughout by lantern slides.

Retirement of Dr. E. C. Thompson.

Dr. E. C. Thompson, who has resigned his appointment as surgeon to the Tyrone County Hospital after forty-four years in that capacity, in which he followed his father, has been the recipient of many expressions of appreciation from his medical colleagues and numerous friends in Tyrone, where he was a deputy lieutenant. The material gifts included: a silver tea and coffee service, a silver cup, an illuminated address, and a cheque. For ten years Dr. Thompson was chairman of the Tyrone Medical Committee, and he was largely responsible for the formation of the Tyrone Division of the British Medical Association, of which he has been chairman and representative; he was also vice-president of the Ulster Branch from 1910 to 1923. He has been a member of the Association since 1876. Dr. Thompson has represented North Monaghan in the House of Commons, and took an active part in framing the Local Government Board Amendment Bill of 1902. As the result of his intervention certain facilities were obtained for county councils which resulted in very vital financial benefits being made available for county hospitals in Ireland.

Scotland.

Suggested Improvements in Medical Education.

An address was delivered at Glasgow University on April 22nd by Sir Norman Walker, who took as his subject "Medical education and qualification in the United States." Principal Sir Donald MacAlister, who presided, said that the Americans were not satisfied with their present system and were sending a deputation to investigate the methods obtaining in Glasgow and Edinburgh. The lecturer detailed the systems which obtained in this country and America, pointing out that in America each State was an authority to itself in making its laws and requiring the doctor to possess the licence of its own State board before passing. Many State boards demanded of students not only a degree from a first-class college, but one year's experience as resident in a hospital, and the lecturer thought the practice of holding intern posts in hospitals should be extended in this country. At the beginning of medical education in America the student went through a period of apprenticeship, covering generally about seven years. This system had failed in course of time, and gradually all over the continent there came into being colleges professing to teach medicine, of which there had been some 400 at various times. Many of these had been purely commercial undertakings, completing a course of medicine in a ridiculously short period, and some of them had contained no facilities for adequate teaching in medicine. A report on these institutions black-listed a number, which accordingly went out of existence. In 1910 there were still 121 medical schools in the United States, in 1925 the number had dropped to eighty, at which figure it now stood. There was a general feeling that the primary and secondary education in this country was better than that in America, but the preliminary requirements of medical schools in America were steadily rising, and now a two years' preliminary course had been introduced into fourteen schools, while one insisted on a four years' course. Many American schools limited their entry to the number of students they could efficiently teach. Thus in one year 11,000 students had applied for admission to twenty-three schools, which had accepted only 6,500. At present in America there was one doctor for every 763 people. In America the principle of frequent class examinations was carried out, and an elaborate system of card-indexing was used to follow the work of the student throughout his course. If the student's work was unsatisfactory, after a warning he was dismissed, and subsequently he found it difficult to enter any of the other schools. When the students graduated, 90 per cent. of them held passes as interns in hospitals, and the lecturer thought there was room in this country for more resident doctors, especially in the smaller hospitals. The American graduand was aged 27 before he could practise, in consequence of this long course, and a four-quarter system was being introduced in an attempt to reduce the period of training by one year. This system had advantages, but the lack of holidays entailed might, however, result in an undue strain being placed upon the student.

Red Cross Work in Glasgow.

At the annual meeting of the city of Glasgow branch of the British Red Cross Society the Lord Provost said that there had been considerable expansion in the work and an increase in the V.A.D. movement in the city. The registered detachments in Glasgow were continuing training with enthusiasm, and would be able to render first-class service if the need should arise. Colonel G. H. Edington, F.R.F.P.S.G., chairman of the branch, seconded the adoption of the report and pointed out that during the year five additional detachments had been formed. The strength of the original four detachments was 134, and the five new detachments would bring in an additional 155 members. One detachment had been raised in the Glasgow and West of Scotland College of Domestic Science, where its members got training in invalid cookery.

England and Wales.

The Paratyphoid Outbreak in London.

THE report of the London County Council's medical officer of health, dated November, 1928, on the outbreak of paratyphoid fever—which it was deemed expedient to mark "private and confidential," copies being distributed only to members of the council and to medical officers of health concerned or interested—is to be removed from the category of private documents and to be published. The report deals comprehensively with the serious outbreak of paratyphoid fever which occurred in London and adjacent districts in July of last year. Statistics giving very full information as to the number of cases and the investigations made in London are included in the report, and also, by the courtesy of the Minister of Health, statistics of cases outside the county. The Minister of Health has intimated that he does not desire to offer any objection to the publication of the report if the Council deems this course desirable in the public interest.

King Edward VII Sanatorium, Midhurst.

An attempt has been made to collate the results of treatment of pulmonary tuberculosis by the induction of pneumothorax at Midhurst since October, 1924; in 63 cases this operation was performed, and the after-histories to October, 1928, have been investigated, so that the statistics relate to patients from one to four years after such induction. In the twenty-second annual report of this institution an account is given of this investigation. In 19 cases, it is stated, the procedure was unsuccessful: in some cases because no pleural space was found or only a small pocket was struck, while in others the treatment could not be continued owing to the presence of many adhesions. Of the remaining 44 patients, 40 are still alive; 34 have now no expectoration, or tubercle bacilli are absent, but in 6 the sputum is still positive. Of these 6, 3 have been advised to have thoracoplasty, and one gave up treatment for no apparent reason. In 18 of the 40 cases the appearance of fluid has been a complication at one time or other during the treatment. Refills have now ceased to be necessary in 11 instances, and all these patients are in good condition. Laryngeal disease was found in 10 of the 63 cases, 2 of which were included in the 19 classified as "failures." One was cured by silence treatment, the other, in whom the disease was very advanced, remained stationary while under artificial pneumothorax treatment and died subsequently. It is believed that this research will eventually contribute useful information on the prognosis of those cases where the treatment failed, although the patient seemed clinically suitable. The work of the x-ray department is steadily growing, and its value has been particularly obvious in controlling the increasing number of cases of artificial pneumothorax. It has not infrequently proved useful in showing that patients believed to be suffering from pulmonary tuberculosis were really the victims of chest disease of some other kind. In the pathological department research on the sedimentation test has been continued, with the result that this test has now been adopted as a useful routine measure. It is proposed to study next the sugar metabolism in tuberculosis, and, in particular, the liability of tuberculous patients to diabetes; the sedimentation test is said to have given some interesting results in diabetic patients. The work of the statistical committee has been continued on the same lines as in previous years, and the familiar tabular statistics are again supplied.

The East End Maternity Hospital.

The East End Maternity Hospital maintains a free midwifery service for poor married women, and a centre for training midwives and nurses who attend at their homes patients unable to enter hospital. The report for the year ending December 31st, 1928, records the treatment of 1,276 in-patients—the largest number in any one year—but a slight decrease in the number of out-patients. The discrepancy is probably only apparent, and may be due to the fact that the mothers are realizing the benefit of entering hospital for their confinement. In the hospital, during the year under review, 1,256 infants were born alive, 36 were stillborn, and there were sixteen sets of twins. In the same period, 14,556 visits from midwives and 108 from doctors were paid to out-patients, and 788 mothers were delivered. On the district, 779 infants were born alive, 21 were stillborn, and there were twelve sets of twins. During the year no cases required Cæsarean section or embryotomy, there were no cases of insanity, and no patients were removed to other institutions; there was one case of eclampsia in a woman who had neglected to come for ante-natal examination fourteen days before her confinement. Two patients died in hospital—one a patient sent in as an emergency case suffering from severe hyperemesis, the other a primigravida of 33 years, with valvular heart disease, who died of heart failure shortly after a prolonged labour. There were no deaths in the out-patient department. Among in-patients there were 55, and among out-patients 13 forceps deliveries, and puerperal pyrexia—that is, a mouth temperature of 100.4° F. or more for twenty-four hours—was observed in 17 in-patients and 5 out-patients. Attendances at the ante-natal clinic totalled 6,927. There were 21 cases of ante-partum haemorrhage among in-patients, 6 due to placenta praevia, and 15 to accidental haemorrhage. Twenty-one of the 1,256 infants born alive in hospital died, 10 within twelve hours of birth.

Correspondence.

THE UNITY OF TUBERCULOSIS AS AFFECTING DIAGNOSIS AND TREATMENT.

SIR,—*It is not a little surprising*—and it is certainly disconcerting—that at this stage in our knowledge of tuberculosis there still seems to remain hesitancy in the ordinary parlance of medicine as to the essential unity of tuberculosis in its various manifestations. The continued use of the adjectives "medical" and "surgical" in relation to tuberculosis is ill advised, and savours of days when the scientific conception of tuberculosis was nebulous. Thanks to the labours of a succession of workers, these days are happily past.

The essential facts in the natural history of tuberculosis have been pretty well determined. Tuberculosis results from the entrance of the tubercle bacillus into the body at any point. The effects of infection—local and systemic—are extremely various, and, as viewed clinically, may emerge almost anywhere. In respect of clinical course there is, subject to certain reservations, a remarkable analogy between tuberculosis and syphilis. Neither the tuberculologist nor the syphilologist can afford to regard his subject in partial fashion. Each stage in the pathological process and every clinical manifestation are within his sphere.

For the tuberculologist the methods of approach, alike in diagnosis and in treatment, are uniform, whatever, and wherever, the outward (clinical) expression of the infection may be. It matters little whether he has to deal with a superficial tuberculosis of skin or mucous membrane, or with tuberculosis of the skeletal tissues, or with tuberculosis of any one or several of the viscera. The common guiding principles of diagnosis, clinical and bacteriological, are well defined, just as are the guiding principles in the diagnosis of syphilis.

What is true of diagnosis is no less true of treatment. Certain principles and methods of treatment are applicable, with adjustment of detail, to the manifold expressions of tuberculosis, wherever these occur. Procedure, applicable to tuberculosis as such, is, of course, subject to modification and adjustment in different situations; and in some cases therapeutic measures applicable to all tuberculosis may require to be supplemented by special procedure because of the structure or tissue involved. Such addition, however, is accidental and not essential to the treatment of tuberculosis as such.

Of the value of tuberculin in the diagnosis of tuberculous disease, wherever situate, particularly when visible to the eye of the observer, there can be no manner of doubt. Its successful use depends, however, on skill and

experience in its application. This implies training and practice, which unfortunately is not available in every school. It is curious how tuberculin is apt to be turned down by men who have seldom used it themselves nor seen it used.

Certain physiological principles form the basis of treatment in tuberculosis and are serviceable more or less in all forms of tuberculosis. Their adjustment in detail requires consideration based on experience. This is likewise true of the therapeutic use of tuberculin, the value of which in suitable cases can hardly be questioned by anyone who has had extensive experience in its use.

It is a vast pity that so great a gap remains between the scientific conception of tuberculosis and the current manner of describing and handling its varying manifestations, each one of which is but *part* expression of *one* far-reaching infection.—I am, etc.,

Edinburgh, April 26th. R. W. PHILIP.

INTRACUTANEOUS TUBERCULIN TESTS.

SIR,—The only important point at issue between Dr. Camac Wilkinson and myself is as to whether the reactions reported by me as positive were really positive or not. Dr. Camac Wilkinson may feel capable of judging these reactions without seeing them; others, perhaps, may think his doing so a little rash.

The work is being repeated on very careful lines, and I hope that your readers (Dr. Camac Wilkinson apart) may be interested to hear my further findings in due course. —I am, etc.,

Cardiff, April 29th. S. LYLE CUMMINS.

SIR,—About twenty years ago I was asked to assist in the diagnosis of a supposed case of tubercle of the urinary tract. The bacteriological findings were negative. I then gave the patient a series of inoculations of tuberculin (B.E.) in increasing doses without any effect on the frequency of micturition. My experience had been that tuberculin even in small doses often aggravates the patient's discomfort in this class of case. I therefore advised that, as no evidence of tuberculous infection could be elicited in this way, the condition was probably not due to tuberculosis.

At the subsequent operation, however, some thickening of the hilum of the kidney was found, it was inferred that this was tuberculous, and the kidney was removed. On section a small stone was found; otherwise the kidney was normal.

Is tuberculin a valuable aid to diagnosis in this type of case? My own experience of tuberculin in diagnosis is too limited to permit a definite conclusion.—I am, etc.,

Manchester, April 29th. J. STAVELY DICK.

THE DISTRIBUTION OF RADIUM.

SIR,—Mr. Souttar's letter in your issue of April 27th (p. 787) upon the distribution of radium in accordance with the recent report of the Radium Subcommittee elaborates the view which I expressed in a letter published in your columns of December 8th, 1928 (p. 1064).

I feel most strongly that until much more experience has been obtained in the treatment of cancer by radium, and until some standardization of dosage, etc., has been established, the distribution of such a powerful remedy will require very great consideration, and the possibility of subdivision of the total quantity to place small amounts in the hands of many surgeons is much to be deprecated. Rather let the distribution, at all events in the first place, be made to such hospitals as have the facilities for using it to the optimum purpose, and are already equipped with a staff experienced in the use of radium and also with a powerful *x*-ray apparatus. We at the Cancer Hospital have found, for example, that it is necessary not only to have special radium officers, but also special research pathologists and a physicist attached to the radiological department.

In the treatment of superficial carcinomata which afford a ready access considerable technical experience is necessary, and for the treatment of deep-seated or intra-abdominal growths it is probable that the direct insertion of emanation capsules, or the treatment "at a distance" by intensive surface applications, will be found more advisable than the burying of needles of radium or its salts into the growth. For both the emanation and the "distant treatment" a greater quantity of radium is required, greater than that possessed in any hospital in England at present; for this purpose in New York, Paris, and Stockholm an amount of four grams and upwards is used. Though I cannot agree with Mr. Souttar that "the whole future of radium treatment lies with emanation," I consider that this method has its uses; a longer experience will alone decide, not only the particular histological form of growth that is amenable to radium treatment, but also the kind of treatment most applicable to each.

I am fully in accord with Mr. Souttar that it is desirable to provide main centres where both hospital and private patients can be treated, and in which accurate observations can be recorded on a number of cases by trained observers; in this way centres may be formed in Britain which will adequately compete with the favoured few abroad.—I am, etc.,

London, W.1, April 29th. R. H. JOCELYN SWAN.

POST-GRADUATE INSTRUCTION IN MIDWIFERY.

SIR,—I am interested in Professor Fletcher Shaw's letter on this subject in the *British Medical Journal* of April 27th (p. 788). If an average of from five to six confinements daily for a week is an intensive course in midwifery the general practitioner can get it in most maternity hospitals. At the Rotunda there were over 2,000 cases in the intern maternity during the past year, and the post-graduate courses continue all the time. There is, in addition, an extern maternity, of somewhat similar figures, in connexion with most institutions. Probably residence for a week in a hospital may be of a *little* assistance, but I do not believe that much real value will be gained under a month. Needless to say, the longer the stay the greater the value.—I am, etc.,

BETHEL SOLOMONS,
Dublin, April 29th. Master of the Rotunda Hospital.

EFFECTS OF DEEP X RAYS ON THE CELLS OF THE BLOOD.

SIR,—The letters in your recent issues from Dr. Paul Cave and Dr. J. H. Douglas Webster rightly call attention to a statement in our paper which, taken by itself, would be too sweeping in character. Our remarks must, however, be considered in relation to the particular type of disease which we had under observation. The cases complicated by sepsis to which we referred were those which, from the nature of the disease, require a series of five or more full-dosage radiations within a period of a few days. It has, however, been found by experience that these patients generally do badly if so treated, and, more or less empirically, the procedure, as Dr. Webster points out, has been adopted of giving fractional doses spread over longer periods. As a control in these cases observation of the phagocytic power should prove of great value.

Our statement would certainly not apply to the treatment of localized infections where the total dosage employed is comparatively small. As Dr. Webster remarks, it is the quantity and not the quality of the rays absorbed that is probably the deciding factor, and the experiments of Dr. Knott and myself appear to show that it is the absorption of the secondary radiations which is of greatest importance. One has not infrequently seen resistant areas of furunculosis, septic glands, infected alveoli, etc., heal completely within a few weeks as a result of a single short application of deep *x* rays. Should, however, numerous radiations be given, or wide areas of the body require to be treated, then the possibility of lowered phagocytic power would come into question. As to the mechanism of the beneficial effect of brief radiation on the septic lesions mentioned, one might suggest that the temporary hyperaemia produced should give increased opportunity for the diapedesis of phagocytic cells, and in this sense the *first* effect of *x* rays in light dosage may quite possibly be stimulant. This

point we did not attempt to investigate, our experiments being concerned only with the frankly destructive effects associated with the larger doses necessary in the treatment of such diseases as the leukaemias and deep-seated neoplasms.—I am, etc.,

London, W.1, April 21st. W. L. WATT.

THE CURABILITY OF ASTHMA.

SIR,—You published on December 25th, 1926 (p. 1221), an *article by myself on* "Instinct and functioning in health and disease," and your interesting leading article on "The curability of asthma" on April 27th (p. 776) induces me to recall it to the minds of your readers. In it I endeavoured to give a short account of what I consider to be the epoch-making work of F. M. Alexander; to show that, according to his views, man, guided largely by the instinct of his tree-dwelling ancestors, fails to function to the best advantage in his modern environment, and particularly in a sedentary environment; that disease is associated with wrong functioning; and that, incidentally, disease or at least symptoms of disease, disappear or tend to disappear with improvement in functioning.

Your article encourages me to repeat this. From observation I have been driven to the conclusion that asthma in cases I have observed was associated with bad functioning—defective methods of sitting, walking, standing, breathing, etc.—and that asthma, or at least the symptoms associated with asthma, disappeared in process as improved functioning was acquired. If these observations could be repeated so as to enable a generalization to be established—and, *a priori*, the possibility of such generalization is likely—then "cure" of asthma can confidently be expected. Such cure would be a real one, for it would mean the removal of the primary and not the secondary cause of the disease.

I have "cured" cases of asthma by removal of spurs from nasal septa, but, as you point out in your leading article, such "cures" are not real ones, since the underlying conditions, which irritation from a nasal source tends to precipitate in the form of an attack of asthma, remain. No one recognizes this more than I, and it is because I do *so recognize* it that I urged and again urge on the medical profession the investigation of methods which seem to me to have at least some relation to a real cure in this, as in other conditions of disease.—I am, etc.,

York, April 28th. PETER MACDONALD.

THE CIRCULATION UNDER THE SPHYGMOMANOMETER CUFF.

SIR,—May I beg the opportunity to comment on Professor Hill's letter (April 20th, p. 745) and at the same time on Dr. Pines's contribution, which came too late for me to deal with in my reply of April 6th (p. 664).

I am very glad to have Professor Hill's assurance that the method used by him "is the same in principle as that of the sphygmomanometer"—on that I rely. That method shows, in the final stage of a rising pressure in the cuff, when the normal circulation has come to a standstill, that "the blood is squeezed out, *the direction of flow being reversed in the artery*" (my italics). This is crucial, for the presence of a reversed flow eliminates the possibility of an impervious main artery; that is my contention, the blood being an incompressible. It must also be noted that the flow of a liquid is inevitably towards the point of least resistance, and this we have seen is situated at the mouth of the brachial at the upper edge of the cuff.

It is true that I did not allude to the difference of pressure in systole and diastole, but it had not been overlooked, nor the closure of the artery during each cardiac cycle from the time when the cuff pressure begins to exceed the diastolic pressure, *as taught*. But to have pursued the subject would have needlessly complicated matters, since my immediate concern was the state of the artery when the cuff pressure had exceeded the systolic pressure.

Dr. Pines's letter drew attention to the interesting observations of Professor Bailliart on the effect, upon the vessels of the disc, of a rising pressure exerted upon the globe of the eye—the artery collapses (is obliterated) rather suddenly when, presumably, the intraocular tension surpasses the arterial pressure. Professor Hill says these effects are exactly what he sees in the web of the frog's foot (though I could find no reference to a *reversed* flow in Bailliart's report); and he considers that this proves the obliteration of the brachial artery in similar case. Dr. Pines holds the same view.

The fallacy in this conclusion (accepting the eye experiment as the counterpart of the sphygmomanometer procedure) seems to me to lie in arguing from a minute local effect to an effect on a scale vastly greater. Thus the effort necessary to shift the blood contained in the artery of the disc (Bailliart limits the effect to the disc) must be incredibly small, as compared with that required to shift the relatively vast volume of blood contained in the brachial artery and its branches. It is the inertia of this mass of blood and the resistance of the walls of the containing vessels which oppose the obliteration of the artery. *Evacuation must precede obliteration*, and, with only a surplus pressure of a few millimetres of mercury as driving force, the time required to yield an appreciable effect must needs be considerable; therefore the blood pressure trial will be over and done with long before any perceptible alteration in the calibre of the larger arteries will have occurred—they will still be widely patent. Time, then, is of the essence of the situation.

Finally, if this be true, is it thinkable, when the cuff pressure begins to exceed the diastolic pressure, that within the time limits of the single cardiac cycle, say one second, the artery will momentarily suffer obliteration?—I am, etc.,

London, W.1, April 23rd. HARRINGTON SAINSBURY.

THE GENERAL PRACTITIONER AND HOSPITAL TREATMENT.

SIR,—In reading the Annual Report of Council in the *Supplement* for April 20th, I find in Appendix XI, Part II, paras. 7 and 8, an attitude that I feel general practitioners should not accept without challenge. It is tacitly assumed that a large number of out-patients are foisted on to hospitals by insurance practitioners, who should be doing the work themselves. This may or may not be so, but it is not by any means the whole story. I, personally, have always regarded a hospital as a place to send a patient either for a second opinion or for special treatment I cannot give; chiefly for a second opinion. I have always sent a letter with the patient with full details and a clear statement that I want a second opinion only.

Now some hospitals are very good indeed and their honorary staff must give an endless amount of their private time to correspondence about hospital patients, but others simply absorb the patient, of whom one hears no more. One large hospital makes a routine practice, in reply to such a letter, of sending a printed form: "Dear Sir, Your patient, Mr. So-and-So, has been accepted for treatment in the out-patient department." In consequence, any interesting cases I have go elsewhere. Other hospitals apparently put one's letter in the waste-paper basket and go on indefinitely "rep. mist."-ing till the patient sickens of going there.

The whole trouble is that the hospitals have no organization for acting in a consultant capacity. Unless individual *members of the staff answer letters privately* it is not done. There should be a stenographer in attendance at the out-patient department and a definite system to see that all doctors' letters are answered, that the patient is not encouraged to come again by being given an out-patient card, and that he is not lost in the mob which besieges the casualty box and receives a gallon of medicine as a placebo. And if a patient is sent to a hospital for special treatment he should have it unless there is a good reason to the contrary. It is not essential to put him first for trial on to the ordinary treatment which he has been having for some time and which has failed. His family doctor should be credited with a little sense.

My point is not a criticism of the honorary staffs, but a criticism of the method, or lack of it, by which the consultative function of the hospital depends on their individual energy in their private time, and is not organized by the governing bodies of the hospitals.—I am, etc.,

Southborough, Kent, April 21st. W. EDWARDS, M.D.

TONSIL PUNCTURE.

SIR,—We are obliged to Drs. Cronin Lowe and Hugh Smith for their interesting comments on our paper. These observers naturally prefer their own methods in the investigation of pathological material, while we prefer ours; but we cannot agree with them on the question of the collection of the material from the tonsil. The use of a platinum loop in a tonsillar crypt may be possible and advisable (1) if the observer wishes to ascertain the condition of the crypt as distinct from the tonsil as a whole, and (2) if, in investigating the crypt, the latter is sufficiently visible and wide-mouthed to admit the loop.

In our paper we gave reasons for judging that the appearance of, and bacteriological findings in, a crypt may lead to fallacious conclusions as to the true condition of the tonsil. In our experience the tonsil which is most difficult to assess, as regards its pathological condition, is the one which is fibrosed and in which it is impossible to find any crypt into which a platinum loop could be introduced. This was one of our chief reasons for adopting the procedure outlined in our paper. It is quite possible that our needle may, occasionally, enter or traverse a crypt, but we think that this is unlikely because the needle is introduced in a direction more or less parallel to that in which the majority of the crypts run, as judged by histological appearances. The needle is not rotated until it is buried deeply in the substance of the tonsil.—We are, etc.,

JEFFREY RAMSAY.
C. M. PEARCE.

Blackburn, April 29th.

Obituary.

FRANK COLE MADDEN, C.M.G., M.D., F.R.C.S.,

Emeritus Professor of Surgery, Royal School of Medicine, Cairo; Consulting Surgeon, Kasr-el-Ainy Hospital, Cairo.

WE have to record with regret the death, at the age of 56, of Professor F. C. Madden, which occurred in tragic circumstances at Cairo on April 20th.

Frank Cole Madden was born in Melbourne in 1873, and was educated at Melbourne University, where he graduated M.B., Ch.B., with honours, in 1893. After holding appointments as senior house-surgeon and acting medical superintendent to the Melbourne Hospital, he continued his medical studies at St. Mary's Hospital, London, obtaining the diplomas of M.R.C.S., L.R.C.P. in 1896, and proceeding to the Fellowship of the Royal College of Surgeons in 1898. In the course of a distinguished career at St. Mary's Hospital he gained an exhibition in surgery and gynaecology, and the Beaney scholarship in surgery. After holding, from 1895 to 1898, posts as house-surgeon and medical superintendent to the Hospital for Sick Children, Great Ormond Street, he proceeded to Cairo, having obtained an appointment as assistant surgeon to the Kasr-el-Ainy Hospital. This was the first of the many posts Frank Cole Madden held in Cairo; he became in the course of time senior surgeon to the Kasr-el-Ainy Hospital, professor of surgery at the Royal School of Medicine, medical officer to the Victoria Deaconess Hospital and the Anglo-American Hospital, medical officer to H.E. the High Commissioner for Egypt and to the British Consulate, and medical referee to the Egyptian State Railways and the Eastern Telegraph Company. During the war he was attached to the Egyptian Expeditionary Force, and was civil surgeon in charge of various military hospitals, the Red Cross Hospital, Cairo, and at the Kasr-el-Ainy Hospital. At the time of his death he was rector of the State University, dean of the faculty of medicine, director of the Kasr-el-Ainy Hospital and of its Medical School, consulting surgeon to the Kasr-el-Ainy Hospital, and emeritus professor to the University of Cairo. In the last New Year's Honours List he was created C.M.G. in recognition of his work in organizing the International Congress of Tropical Medicine and Hygiene, held at Cairo in December, 1928. It is not unlikely that his arduous work in relation to this congress, added to the pressure of his many other duties, contributed to the breakdown that preceded his tragic end. Madden's work and personality were highly appreciated in Egypt, and his death was a shock to his friends and to the numerous students, doctors, patients, and officials with whom his work had brought him in contact. For thirty years he devoted himself to raising the standard of medical education and practice in Egypt.

Throughout his professional career Frank Cole Madden was an active member of the British Medical Association. He was made president of the Egyptian Branch from 1924 to 1925, its representative in 1926, and a member of the Egyptian Branch Council from 1926 to 1928. His special interests were tropical surgery and schistosomiasis, and his publications included *Bilharziasis* (1904), the *Surgery of Egypt* (1919), articles on schistosomiasis in Choyce's *System of Surgery* (1923) and in Byam and Archibald's *Practice of Medicine in the Tropics* (1921), and numerous papers on surgical subjects in the various medical journals. He is survived by a widow, two sons, and two daughters.

The medical profession in Limerick and the surrounding counties has been deprived by the death, on March 26th, of Dr. WILLIAM AUGUSTUS FOGERTY, a highly esteemed and learned colleague. He was in his seventy-second year, and had practised in every department of his profession in his native city for more than forty years. He received his medical education at Queen's College, Cork, graduating M.D., M.Ch., M.A.O. in 1885. Appointments held by him included honorary surgeon to Barrington's Hospital, consulting surgeon to the Lying-in Hospital, and visiting surgeon to the Limerick County Infirmary. He was a brilliant, careful, and successful operator, and in every branch of his art he was an acknowledged master. As aurist, oculist, and gynaecologist he had attained a very high standard, while his knowledge of the collateral sciences was extensive and accurate. He excelled as a botanist, and at one time held temporarily the chair of natural science in Queen's College, Cork, as it was then designated. His colleagues fully realized and appreciated as they deserved the many various qualities and attainments that combined to stamp him as a medical practitioner of the first rank. Some years ago he was mainly instrumental in the formation of a society that had for its object the bringing together of the local medical men for friendly discussion of matters affecting their common interests, and consolidating their position, especially that of the junior members; as, for instance, when their services might be required by working-men's unions for collective attendance. This secured an adequate, reasonable fee, and eliminated a possibly destructive competition; it was, moreover, most useful in obviating misunderstandings. He was a member of the British Medical Association. He also found time to devote to the duties of alderman and to serve on a conciliation board for the adjustment of disputes between capital and labour, the utmost confidence being placed by all in his judgement and impartiality. He was chairman of the Citizen's Protective Society, and of the local branch of the Rotary Club. Sometimes he would appear as a public lecturer, speaking in a masterly and most pleasing manner. His funeral was one of the largest in Limerick for many years. All classes and creeds, high and low, rich and poor (for to the poor he had given unstintingly his time and skill in the wards of Barrington's Hospital), crowded round his grave. All felt that Dr. Fogerty had brought credit to his native city and honour to his profession.

The following well-known foreign medical men have recently died: Geheimrat SATTLER, formerly professor of ophthalmology at Leipzig, aged 84; Dr. ERNST LEUTERT, emeritus professor of otology at Giessen, aged 66; Dr. PAUL ALBRECHT, a Vienna surgeon, aged 55; Dr. LOUIS PHILIPPE NORMAND, formerly president of the College of Physicians and Surgeons of Quebec, and Commander of the Order of St. Gregory the Great, aged 65; Dr. ENRICO MORSELLI, an Italian psychiatrist; Dr. LÉON BOUVERET, an eminent physician of Lyons, aged 79; Professor A. SWAEN, founder of the Anatomical Institute of Liège and member of the Royal Academy of Medicine of Belgium; and Dr. R. JOCQS, formerly president of the Société d'Ophtalmologie.

Medico-Legal.

DEATH UNDER ETHER ANAESTHESIA.

A VERDICT of "Accidental death consequent upon an excessive amount of ether being administered for a lawful purpose" was returned at an inquest held in South London on April 23rd on a 9-weeks-old child who died while undergoing a minor operation at a large general hospital. In evidence it appeared that the operation had been performed by a dresser under the supervision of a casualty officer who had qualified about four months previously, and the anaesthetic administered by an assistant casualty officer qualified about a week. There had been no undue haemorrhage, but, owing to the circumstances in which it had been performed, the time taken for the operation was rather longer than usual. After the patient had been anaesthetized for twenty-five minutes breathing stopped suddenly; oxygen and brandy were administered, artificial respiration was started at once, restoratives were injected, and hot-water bottles were placed at the patient's feet. A pathologist in evidence said that the child was perfectly healthy and that the operation was a proper one. He added that it was the usual practice in all teaching hospitals for dressers to perform simple operations under supervision. The coroner stated that an experienced anaesthetist would have noticed something wrong before respiration ceased.

DEATH FROM MERCURY POISONING.

A verdict of "Accidental death" was recorded on April 23rd in the case of a boy, aged 7, who had died on March 24th at Islington. At previous hearings the mother stated in evidence that the boy had been under treatment at a large general hospital for a skin rash. On March 22nd she was given a box of fourteen grey powders at the hospital, to be administered to the boy according to definite instructions; this box she gave him to carry, but before she could stop him he had swallowed two of the powders in the street. When she got home she put the powders on the mantelpiece, but since the boy's death she had been unable to find the box or the powders. Sir Bernard Spilsbury said that the prescription for the powders contained mercury, but he did not think two grey powders would seriously affect the child. Death was due to acute colitis. Dr. Lynch stated that he had found traces of mercury in the boy's organs: there was one-twelfth of a grain in the kidneys, and he thought mercury poisoning was the cause of death. There were two similar cases of death from mercury poisoning on record. Sir Bernard Spilsbury said that in view of the analyst's report, and from a further examination he had made, he concluded that death was due to syncope resulting from acute colitis brought about by mercury poisoning. In recording his verdict the coroner said that precise instructions had been given with the powders at the hospital, but the child, apparently, had taken an excessive dose.

The Services.

DIRECTOR OF MEDICAL SERVICES IN INDIA.

MAJOR-GENERAL W. H. S. NICKERSON, V.C., C.B., C.M.G., late R.A.M.C., has been selected for the appointment of Director of Medical Services in India in succession to Major-General Sir Walter H. Ogilvie, K.B.E., C.B., C.M.G., I.M.S., who will retire on September 2nd.

DEATHS IN THE SERVICES.

Major Louis Hope Loyal *Mackenzie*, Indian Medical Service, of Tomich, Beauly, died at Parachinar, on the North-West Frontier of India, on April 5th, aged 47. He was educated at Cambridge (Trinity College), where he graduated as M.A. with honours in 1902, B.C. in 1907, and M.B. in 1908; and at St. Thomas's Hospital, taking also the M.R.C.S. and L.R.C.P. in 1907. Entering the I.M.S. as lieutenant on July 31st, 1909, he became captain after three years' service, got a brevet majority for war service on June 3rd, 1917, and became permanent major on July 31st, 1921. He served in the recent war of 1914, and was mentioned in dispatches in the *London Gazette* of August 15th, 1917. For several years past he had been in political employ in the North-West Frontier Province.

Captain John Crawford Burns, R.A.M.C. (ret.), died at Aberdeen on February 26th, aged 34. He was born on January 15th, 1895, the second son of the late Walter Burns of Denholm Hill, Roxburgh, and was educated at Edinburgh, where he graduated as M.B. and Ch.B. in 1917, joining the Special Reserve of the R.A.M.C. as lieutenant on August 9th, 1917. He afterwards took a commission in the regular R.A.M.C. from the same date, and was promoted to captain on February 9th, 1921. He was then placed on half-pay, and transferred to the retired list last year. He served in the war of 1914-19.

Universities and Colleges.

UNIVERSITY OF CAMBRIDGE.

AT a congregation held on April 26th the following medical degrees were conferred:

M.D.—W. S. Hunt, A. C. Hampson, W. Brockbank, W. Smith.
M.B., B.Chir.—J. O. R. Murray, J. G. Milner, F. D. Morgan.
M.C.—C. A. Francis, E. Clayton-Jones, E. A. E. Palmer.
B.Chir.—E. B. Murrell.

UNIVERSITY OF LONDON.

THE following candidates have been approved at the examination indicated:

DIPLOMA IN PSYCHOLOGICAL MEDICINE (*with special knowledge of Psychiatry*).—J. Braithwaite, Catherine M. Hext.

UNIVERSITY COLLEGE.

The Faculty of Medical Sciences of University College announces that an examination for the Buckmill Scholarship (of the value of 160 guineas) and two Exhibitions (each of the value of 55 guineas) will be held in June. Full particulars and entry forms may be obtained from Mr. C. O. G. Douie, secretary, University College, Gower Street, London, W.C.1.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

AN ordinary comitia of the Royal College of Physicians of London was held on April 25th, when the President, Sir John Rose Bradford, was in the chair.

Fellowship.

The following were elected Fellows on the nomination of the Council:

R. W. Marsden, M.D. (Manchester), Rupert Waterhouse, M.B. (Bath), A. G. Yates, M.D. (Sheffield), K. D. Wilkinson, O.B.E., M.D. (Birmingham), T. L. Hardy, M.D. (Birmingham), Geoffrey Bourne, M.D. (London), C. T. Champion de Crespigny, *D.S.O., M.D.* (Adelaide), A. C. Roxburgh, M.D. (London), B. T. Parsons-Smith, *M.D. (London)*, A. W. M. Ellis, M.D. (London), H. Gardiner-Hill, M.B.E., M.D. (London), J. H. Sheldon, M.D. (Wolverhampton), J. M. H. Campbell, O.B.E., M.D. (London), J. H. Dible, M.B. (Liverpool), D. H. Paterson, M.D. (London), J. C. Bramwell, M.D. (Manchester), A. F. Tredgold, M.D. (London), Hugh Gainsborough, M.D. (London), C. H. Kellaway, M.D. (Melbourne), A. H. Southwaite, M.D. (London), B. Hunter, M.D. (London), H. M. Turnbull, M.D. (London), C. A. Lovatt Evans, D.Sc., F.R.S., M.R.C.S., L.R.C.P. (London).

Membership.

The following, having satisfied the Censors' Board, were elected Members:

R. S. Aitken, M.B., J. Anderson, M.D., R. W. Brookfield, M.D., W. L. Chrestman, M.B., H. A. Clegg, M.B., Gladys Mary Evans, M.D., F. R. Ferguson, M.D., W. E. Fisher, M.D., H. G. Garland, M.B., H. K. Goadby, M.B., C. A. Keele, M.B., A. J. May, M.B., M. M. Mehta, M.B., L. Minski, M.D., A. G. Ogilvie, M.B., W. E. Rees, M.D., H. M. Sein, M.B., E. W. Skipper, *M.B.*, W. R. O. Stowe, M.B., M. M. Suzman, M.D., P. C. Varrier-Jones, *L.R.C.P.*, W. S. Whimster, *M.D.*, C. E. Woodrow, *L.R.C.P.*

Licences.

Licence to practise were granted to the following 108 candidates:

E. G. Abdel-Malek, D. A'Brook, Annie D. M. Adams, C. L. Ahluwalia, *Annie F. Allport*, C. Arthur, J. C. Arthur, S. Alstead, A. R. Banham, I. T. Barling, J. R. J. Beddard, D. Bielenky, R. E. Blake, M. Bloom, R. K. Bowes, A. M. Boyd, J. S. B. Bray, A. D. D. Broughton, C. W. F. Burnett, E. L. Butler, *C. E. Candwell*, M. A. Chamberlain, P. P. Chanda Nambiar, *Rosa O.* J. Clark, J. O. Clyde, J. R. Colvillo, S. J. Cope, D. M. Craig, F. A. D'Abreu, A. M. D'Cotta, J. G. Dathan, H. R. J. *Donald*, *E. S. Fossey*, I. Friedman, Dorothea L. Geo, T. Giblin, A. Gilpin, *Joan Goodger*, H. Gordon, E. Grundy, P. N. Hansen, K. W. D. Hartley, Dorothy C. Hay, G. Herbert, J. H. Howells, *D. Hugo*, A. H. Hussein, A. E. Hutton, K. L. James, W. H. P. Jones, *C. Jones*, Mary E. H. Jones R. A. Jones, L. D. Khatri, H. V. Knight, R. G. Krishnan, R. J. Krogh, A. J. C. Latchmore, J. C. Lee, J. M. Leggatt, F. G. Lewis, O. V. Lloyd-Davies, J. Y. Lucas, H. G. McGregor, C. G. Millman, A. J. Moffatt, B. A. Moss, L. P. Nay, W. L. Noustatter, J. C. Nicholson, R. J. L. O'Donoghue, J. R. Owen, E. R. G. Passo, A. S. Philps, R. K. Price, K. H. Pridie, A. B. Rao, *J. B. A. Reynolds*, *R. A. C. Rice*, N. W. *Roberts*, C. St. Johnston, J. G. Sandrey, R. W. Scanlon, C. P. Scott, J. D. W. Sheddon, M. D. Sheppard, B. Singer, W. F. Skaife, D. R. Subaliskaw, W. C. Smallwood, E. S. C. Tanner, L. Taylor, K. S. Thon J. J. van Niekerk, E. Vitenson, L. Wheeler, B. Williams, D. C. Williams, E. R. Williams, Sybil D. Williams, Kathleen Wilson.

Dr. F. E. Fremantle was appointed delegate to the fourth Imperial Social Hygiene Congress.

SOCIETY OF APOTHECARIES OF LONDON.

THE following candidates have passed in the subjects indicated:

SURGERY.—B. L. Fishout, E. T. Garthwaite, E. Marks, A. N. de Monte, C. J. Poh, P. U. Rao.
MEDICINE.—B. L. Fishout, D. F. Michael, C. J. Poh, H. Whitby.
FORENSIC MEDICINE.—H. M. Feldman, H. Markus, A. W. Tam.
MIDWIFERY.—L. Banszky, G. R. Davies, C. W. Ellison, D. C. Ghose, C. F. H. Quick, T. Singh.

The diploma of the Society has been granted to Messrs. H. M. Feldman and D. F. Michael.

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

PARLIAMENT will be dissolved next week. This week the House of Commons considered the Finance Bill and departmental estimates, and both Houses were occupied with the final stages of bills previously discussed.

At the House of Commons, on April 29th, with Dr. Fremantle as chairman, Conservative members entertained Mr. Chamberlain and Sir Kingsley Wood to dinner.

Local Government (Scotland) Bill.

Third Reading in the House of Lords.

The House of Lords, on April 24th, read the Local Government (Scotland) Bill a third time after making minor amendments to it. By one of these the House, on the motion of Lord YOUNGER, restored to Clause 35, which deals with medical officers of health and sanitary inspectors, a subsection which had been deleted by inadvertence when Lord Younger had previously carried an amendment varying the operative words of the clause. The subsection which, with the approval of the Government, was restored on April 24th runs:

"Except with the sanction of the Department of Health, no person shall, after the commencement of this Act, be appointed sanitary inspector of a county or burgh unless he possesses such qualifications as may be prescribed by the Department of Health."

The bill was returned to the House of Commons, which on April 26th considered the Lords' amendments.

The Lords' Amendments in the House of Commons.

The Lords' amendments to the bill were considered by the House of Commons on April 26th. The Commons agreed to the subsection added by the Lords to Clause 5. This clause makes provision relating to the transfer of functions, and Sir JOHN GILMOUR explained that the subsection added by the Lords was designed to meet a case where a district board of control would disappear, and where its functions would be transferred to two separate county councils. The subsection authorized that the appointment of representatives should be made either by the two counties jointly or by a joint committee, or else that a certain number of appointments should be allotted to one county council and a certain number to the other. Sir John added that he thought this a good working agreement.

The Commons also agreed to an amendment made by the Lords in Clause 11, which provides for the combination of local authorities. Sir John Gilmour said the Lords' amendment was made to meet circumstances such as would occur at Paisley in consequence of the transfer of an asylum. The amendment was introduced by the Government after conference with the authorities concerned. On Clause 35, dealing with the appointments of medical officers of health and sanitary inspectors, Sir John Gilmour moved that the Commons disagreed with the amendment which, on the motion of Lord Younger, the Lords had carried. This amendment laid down that sanitary inspectors of small burghs should be succeeded on any vacancy arising after the Act coming into force *ipso facto* by the sanitary inspector of the county within which the burgh was situated. Mr. W. WATSON supported Sir John Gilmour's proposal. He said that considerable hardship would be imposed upon certain burghs if they had burgh surveyors who were not also sanitary inspectors. Mr. WESTWOOD also thanked the Government, and said many people would be glad to know that the Government had sufficient backbone to face the House of Lords. The House of Commons then disagreed with the Lords' amendment, and subsection (1) of Clause 35 reverted to its original form, in which the provision that a county official should succeed to a vacancy in a small burgh only applied to medical officers of health.

Other amendments concerning the transfer of officers and rights in superannuation funds or compensation were accepted by the Commons, and the bill was returned to the Lords with a statement of the reasons for disagreeing with the Lords' amendment on Clause 35.

Radium.

Answering Dr. Fremantle, on April 25th, Mr. CHAMBERLAIN said the British Empire Cancer Campaign was not consulted before the Government decided its action on the proposed radium appeal. The Campaign would not be asked to undertake the appeal to the public for funds. Mr. Chamberlain added that, while appreciating the work being done by the British Empire Cancer Campaign, he hesitated to accept Dr. Fremantle's estimate of it as the principal association for the promotion of cancer research. Dr. FREMANTLE asked whether Mr. Chamberlain knew that the Cancer Campaign had prepared an appeal on an extensive scale. Mr. CHAMBERLAIN replied that he understood that was for research only, whereas, according to the general opinion, the need was for more than research. Dr. FREMANTLE retorted that the subcommittee of the Committee of Civil Research had used the word "research." He asserted that the Cancer Campaign had appealed widely for radium, that they had a large stock in hand, and that they were therefore the proper body to do what was suggested by the Committee of Civil Research. Mr. CHAMBERLAIN said Dr. Fremantle was mistaken if he thought that the whole of the recommendations of the Committee dealt with research. He saw no need for giving the House of Commons an opportunity to discuss the question before an appeal was made, and added that he had every reason to suppose this appeal would be before the General Election. Answering Mr. Robert Morrison, Mr. CHAMBERLAIN said the subcommittee of the Committee of Civil Research was not in a position to secure any guarantee that 20 grams of radium bought through a single agency would be cheaper than much smaller amounts bought by numerous purchasers, but their opinion on this point, with reasons, was set out in their report.

Small-pox.

On April 25th, in an answer to Dr. Fremantle, Mr. CHAMBERLAIN said that, according to the information then available, two cases of small-pox had been notified during the past week from the *Tuscania*. No further deaths had occurred, and no case of small-pox had been reported from the *Mashobra*. Information on the vaccinal history of the fatal cases from the *Tuscania* was not then available.

Mr. LOCKER-LAMPSON told Dr. Fremantle, in a written answer on April 25th, that the regulations with which travellers proceeding from this country to France had at that date to comply provided that:

(1) All persons in possession of certificates to the effect that they had been vaccinated within the last five years and not more recently than ten days would be allowed to land without hindrance.

(2) Those without such certificates would be required to fill in a sanitary passport, giving their names and addresses and their destination, so that they might be subject to medical supervision during the next fourteen days.

(3) There would be no compulsory vaccination on disembarkation.

He understood that at Dieppe holders of certificates were also being asked to submit their arms for medical inspection. At Havre the special regulations introduced by the mayor, and announced in the press, were still being enforced. The length of time which these regulations would remain in force must necessarily depend upon circumstances.

Dr. FREMANTLE asked whether these matters would in future be arranged through the International Committee of Public Hygiene, at Paris, or through the Health Organization of the League of Nations, at Geneva. Mr. LOCKER-LAMPSON replied that, in the opinion of the British Government it was not possible to leave the details of administration in such matters to an international body. The French Government had acted in the present case in accordance with Article 42 of the International Sanitary Convention signed at Paris on June 21st, 1926.

Sir KINGSLEY WOOD told Sir Basil Peto, on April 30th, that there was no quarantine station or quarantine ship at the port of Liverpool. The measures taken at Liverpool on the arrival of the s.s. *Tuscania* were in accordance with the procedure laid down in the International Sanitary Convention of 1926. Sir BASIL PETO asked whether, in the absence of any quarantine station and ship, the crew and passengers were distributed all over the country; and whether at East Ham and West Ham 24 cases of small-pox arose from contact with a steward from the *Tuscania* who had seven or eight children attending an elementary school at Leyton Road. Sir KINGSLEY WOOD: Yes, Sir; the Minister of Health and I have answered several questions on this matter, giving an exact account of what has taken place. Obviously, the conditions which have to be complied with are those of the International Sanitary Convention, but the real lesson of the whole affair is the necessity for vaccination.

Power Stations and the Smoke Nuisance.

Colonel ASHLEY announced, on April 18th, that the Electricity Commissioners had asked the Government chemist to examine the results of the investigation by the London Power Company on the problem of eliminating sulphur fumes from smoke. He was informed that research chemists had already obtained satisfactory results in laboratory experiments. In conjunction with the Department of Scientific and Industrial Research the Government chemist would advise the First Commissioner of Works and the Electricity Commissioners on the efficacy of the measures proposed for the new power station at Battersea. Only the newer power stations in the London area were subject to the condition that there should be the best known precautions for the consumption of smoke and for preventing, so far as reasonably practicable, the evolution of oxides of sulphur.

In the House of Lords, on April 25th, Lord JESSEL called attention to "the menace to the health and amenities of London by the erection of the Battersea power station." He said the proposed site was close to Battersea Bridge. The station, if erected, would be the second biggest station in the country. It would have six chimneys, each 275 feet high. The Electricity Commissioners, in giving consent to the station, had imposed the condition that "the company shall, in the construction and use of the said generating station, take the best known precautions for the due consumption of smoke and for preventing as far as reasonably practicable the evolution of oxides of sulphur, and generally for preventing any nuisance arising from the generating station or from any operations thereat." Protests had been made, but it seemed that nobody had powers over the Electricity Commissioners. He believed that laboratory experiments had not devised any means of obviating the sulphur nuisance. At St. Pancras the nuisance from the power station was so great that the Municipal Reformers nearly lost the last election because of the disgust of the inhabitants at the fumes from the power station. In Poplar the power station caused great inconvenience, and dishes in households were filled with grit emanating from the power station. Surely the time had come when these big power stations should not be placed in the centre of large cities like London.

Lord BIRKENHEAD defended the erection of the Battersea power station.

Lord LONDONDERRY, First Commissioner of Works, said the danger which was represented to threaten the parks and public buildings of London was less important than the health of the population. The Minister of Health would not allow the scheme to go forward unless he was satisfied there was no danger in that direction. It was important that these generating stations should be in the centres where the chief loads were to be carried. If they were placed at a distance from the centres which they were destined to supply a greatly increased cost would fall on the public. Generating stations must also be close to water. The difficulties connected with smoke and grit had been overcome, and they need no longer be a nuisance to the public. All coal fires gave off sulphur fumes, and these fumes existed in all centres of population. The erection of the Battersea station would permit the elimination of three stations—at Horseferry Road, Westminster, Shepherd's Bush, and Earl's Court. The reduction of sulphur fumes by elimination of these stations and the establishment of one station was calculated at 30 per cent. In addition, the new station would reduce the consumption of coal in a great number of houses, with consequent reduction of the sulphur fumes now given off by fires. The further extension of the Battersea power station by two-thirds would not be undertaken unless the Minister of Transport, the Minister of Health, and the First Commissioner of Works were satisfied on the advice of the Government chemist and of the Scientific and Industrial Research Department that there was no danger accruing.

Lord CRAWFORD said experience in Lancashire showed that people within 300 yards of a big chimney often did not suffer so much as those who were half a mile or more from it. The limit of 300 yards which the Electricity Act imposed on complainants was a great hardship on people who lived beyond that limit, and had no means to state their case.

Lord LONDONDERRY repeated his assurance that only one-third of the Battersea scheme was being undertaken now, and Lord JESSEL withdrew his motion.

Schools for Mental Defectives and Nursery Schools.

Lord EUSTACE PERCY, speaking on the vote for the Board of Education, in the House of Commons, on April 23rd, said that to complete the balanced scheme of education they must give a more natural and normal place in the structure to two types of school which had hitherto stood rather outside the elementary school system—the special school and the nursery school. A recent report by the committee appointed by Sir George Newman had indicated certain defects in their methods of dealing with mentally deficient children. He (Lord E. Percy) had been criticized for waiting for this report before deciding his policy in regard to schools for mental defectives, but he believed that the committee's work would enable them to make within the general educational system a more comprehensive and varied provision for the needs of such children than had been possible on the basis of a procedure of medical certification. That certification had tended to divide retarded children into two fixed and somewhat artificial categories. The nursery school presented a different problem, but was also a subject on which all needed to clarify their views by thorough investigation. He had left this problem at the stage at which he had found it—that of isolated experiments. Those experiments had not been unfruitful. They had led the Board to modify its views on certain points, such as the size of nursery schools, but the Board of Education could not be content either with the present rate of progress or with any of the proposals which had recently been put forward on this subject, and which seemed to him to amount to a little more than a [illegible] experiments. The time had come w[illegible] problem should be brought into the focu[illegible] recently announced, the Board of Education proposed to conduct a comprehensive inquiry with this object.

Education Estimates for Scotland.

The Education Estimates for Scotland were also debated on April 23rd, and Mr. D. M. COWAN congratulated the Scottish Education Department on the fact that recently an education research committee had been set up in Scotland. That committee included representatives of the medical profession. This enthusiastic body was devoting itself to the study of the child mind. The object of the committee would be not only to provide a good educational course for the normal child, but to find out how the backward child could be specially dealt with.

Mr. JOHNSTON said that in the report of the Scottish Education Department it was admitted that the nutrition of over 6 per cent. of the school children examined by the school medical officers was below the average. Within the last ten years things had gone back in this respect. Medical inspection of school children was very briefly dealt with in the report of the Scottish Education Department. The annual report of the Scottish Board of Health showed that 73 per cent. of the children attending schools suffered from defective teeth. The dental services were inadequate. Then there was rickets—a poverty disease; and defective eyesight, which amounted to 5 per cent. and was still growing. Some of the schools were designed and built many years ago, and a large amount of the children's troubles arose directly from bad heating arrangements and bad ventilation.

Dr. ELLIOT said that the school accommodation in Scotland had been considerably enlarged in the last few years. It was obviously a mistake to mix up sound with sick school children, and defective children with normal children. There was every reason to believe that with the unification of the activities of the local authorities it would not be necessary to overcrowd educational institutions with school clinics, while, a street or two away, or it might be only across the street, there were facilities for carrying out these examinations in buildings designed for the purpose, where the work could be done without trenching on the premises available for the teachers for carrying out the main purposes of the school.

The break between the school health services and those of the local authority was a flaw in their educational system which the Local Government Bill would remove. He would report to the Secretary of State for Scotland that the House considered greater attention should be paid to the physical condition of school children. The debate on the vote was adjourned.

Bills.

On April 25th a Standing Committee of the House of Commons, which included Dr. Fremantle, passed the Preservation of Infant Life Bill through the committee stage with a verbal amendment, and altered the title to the Infant Life Preservation Bill. The bill has already passed the House of Lords.

The Royal Assent was given on April 25th to the Army and Air Force (Annual) Act.

In the House of Lords, on April 30th, Lord DESBOROUGH moved the second reading of the Pharmacy Bill. He said the bill was designed to secure reciprocity in regard to qualified pharmacists between Great Britain and Northern Ireland. The bill was read a second time.

Insurance Medical Service.—Mr. CHAMBERLAIN told Mr. Thurtle, on April 25th, that he had seen reports of an inquest recently on the death of a Shoreditch man at which the coroner had spoken of the inadequacy of the home treatment of this patient and of insured patients in general. Mr. Chamberlain said he did not think the case afforded sufficient reason for a general inquiry into the home treatment given to insured persons. There were very few complaints about this treatment. Insurance practitioners were required by their terms of service to visit and treat patients whose condition so required at any place within the districts in which the practitioners had undertaken to visit patients. Any complaint that a practitioner had failed to visit a patient when necessary should be made in the first instance to the local Insurance Committee, who must have it investigated.

Deaths in England and Wales for the First Quarter of 1929.—Sir KINGSLEY WOOD informed Mr. Malone, on April 23rd, that the returns issued by the Registrar-General showed that in the first quarter of this year the deaths in 107 great towns in England and Wales exceeded the births by 25,108. The deaths numbered 111,003, influenza being certified as one of the causes of death in 12,711 cases. No similar figures were yet available for the country as a whole. The Medical Research Council were promoting researches into the group of diseases to which influenza was believed to belong.

Smuggling of Drugs.—On April 16th Sir V. HENDERSON, replying to Sir R. Thomas, said that the Home Office had no information indicating that drugs were being smuggled into this country on a large scale through the ports of Cardiff and Swansea.

Refuse Dumps.—The public cleansing inspector of the Ministry of Health has inspected refuse tips at Little Britain and Iver, and the Minister of Health has appointed a departmental committee to consider his report and to recommend what measures should be taken on it. In the meantime, the Minister is making further inquiries at Iver, where he understands a new tip has been started.

Notes in Brief.

Pending receipt of a report from the Committee of Inquiry, the Minister of Agriculture is unable to reach a decision on the future of the Royal Veterinary College. The committee is still taking evidence.

Sir W. Joynson-Hicks informed the House that in the year 1928 coroners' verdicts in England and Wales found that 3,331 males and 1,464 females had committed suicide. He would endeavour to ascertain how many of these committed suicide by gas.

Medical News.

KING EDWARD'S Hospital Fund for London has sustained a severe loss in the death of Lord Revelstoke, who in 1906 was appointed as one of the first members of the newly formed Finance Committee. In 1915 he succeeded the late Lord Rothschild as Treasurer and Chairman of the Committee. Lord Revelstoke devoted unremitting attention to the financial welfare of the Fund, and to the maintenance of its stability. On April 30th it was announced that he had bequeathed the munificent sum of £100,000 to the Fund.

THE Sir George Birdwood Memorial Lecture will be given at the House of the Royal Society of Arts, John Street, Adelphi, W.C., on Friday, May 10th, at 4.30 p.m., by Mr. P. Johnston-Saint, M.A., F.R.S.E., secretary of the Wellcome Historical Medical Museum. The subject of this year's lecture is "*An outline of the history of medicine in India*," and Sir E. Denison Ross will preside.

A SERIES of dances is being arranged by different London hospitals in aid of the Royal Medical Benevolent Fund Guild, in the Hall of the British Medical Association House, Tavistock Square, W.C.1. The first of these, organized by Guy's Hospital, will be held on Thursday, May 16th, from 8.30 p.m. to 12.30 a.m. Tickets, 6s. each, or 11s. for two, which include light refreshments, may be obtained from Mrs. Hale-White, 1, Portland Mansions, W.1; Miss V. S. Fripp, 19, Portland Place, W.1; or Mr. Winston, Medical School Office, Guy's Hospital, S.E.

TWO lectures on the physiology of glycogen will be given at the London Hospital Medical College, Mile End, E., by Dr. J. J. R. Macleod, F.R.S., regius professor of physiology in the University of Aberdeen, on May 16th and 17th, at 5.30 p.m. The first lecture will deal with the absorption of sugar, the glycogen of the liver, and the glycogen of the muscles, and the second lecture with the significance of sugar tolerance curves and the role of insulin and other hormones in the control of carbohydrate metabolism. Professor Leonard Hill, F.R.S., will take the chair at the first lecture. Admission is free.

AT a sessional meeting of the Royal Sanitary Institute to be held on May 17th and 18th, in the Town Hall, Devizes, discussions will take place on the Milk and Dairies Order, 1926; on meat inspection; and on some aspects of local government on air, water, and sewerage.

A CLINICAL meeting will be held at the East London Hospital for Children, Shadwell, on Wednesday next, May 8th, at 4 p.m., when a short discussion on the significance of otitis media in influenza will be held, followed by a demonstration of cases of interest. All practitioners are cordially invited.

AN open meeting of the London Association of the Medical Women's Federation will be held in the Hastings Hall, British Medical Association House, Tavistock Square, W.C.1, to-day (Friday, May 3rd) at 8.30 p.m. A report of the Cancer Research Committee of the Marie Curie Hospital on three years' work on the treatment of cancer of the uterus with radium will be presented, with demonstrations of technique and cases.

THE eighty-first half-yearly dinner of the Aberdeen University Club, London, will be held at the Trocadero Restaurant on Thursday, May 16th. The secretary's address is 9, Addison Gardens, W.14.

THE Fellowship of Medicine announces that the special course of instruction for the July M.R.C.P. examination will begin on May 7th, when Dr. B. T. Parsons-Smith will deliver a lecture on the assessment of valvular heart disease; this will be followed on Friday, May 10th, by his second lecture, entitled "The treatment of cardiac failure." These lectures will be given at the Medical Society lecture room, 11, Chandos Street, on Tuesdays and Fridays at 8.30 p.m. for eight consecutive weeks. On May 6th a course in venereal disease will start at the London Lock Hospital, Dean Street, occupying each afternoon for one month and consisting of clinical instruction. A series of four lecture-demonstrations on ante-natal treatment will be given by Professor Dame Louise McIlroy on successive Fridays from May 17th to June 7th (both dates inclusive) at 5 p.m. at the Royal Free Hospital. From May 27th to June 8th a course in diseases of infants will be held at the Infants Hospital, Vincent Square, occupying each afternoon. Free demonstrations will be given during the week: on May 8th, at 2.30 p.m., in the children's out-patient department at King's College Hospital, by Dr. Wilfrid Sheldon, and on May 10th, at 2 p.m., at the Cancer Hospital by Mr. A. Lawrence Abel. Copies of all syllabuses, tickets of admission, copies of the *Post-Graduate Medical Journal* (issued monthly), and particulars of the general course of work provided by the Fellowship, may be obtained from the secretary, 1, Wimpole Street, W.1.

THE final programme has now been issued for the congress of the Royal Institute of Public Health, to be held at Zürich from May 15th to 20th. Copies may be obtained from the honorary secretary of the Institute, 37, Russell Square, W.C.1.

DR. WALTER E. MASTERS and Dr. Leonard P. Lockhart have been called to the bar by the Middle Temple and Gray's Inn respectively.

AN anonymous donor has given £2,000 for the purchase of radium for the treatment of cancer at the Royal Victoria Infirmary, Newcastle-upon-Tyne.

THE National Baby Week Council draws attention to the fact that it supplies, free of charge, a leaflet on vaccination addressed to parents. Application should be made to the office of the Council, 117, Piccadilly, London, W.1.

THE April issue of the *Archives of Surgery* is a special number in honour of the sixtieth birthday of Professor Harvey Cushing, C.B. All the articles are contributed by former pupils, and cover a wide range of surgical and anatomical subjects.

AT the fourth congress of the German society for combating rheumatism, held at Wiesbaden on April 5th and 6th, a committee was appointed to collect statistics of the incidence of rheumatic diseases.

THE medical tour organized annually by the Italian State Tourist Department to spas and other health resorts in Italy will be made this year from September 10th to 26th, and the party will be accompanied as in previous years by an English-speaking Italian medical practitioner. Each of those participating is allowed to bring one relative. Special train facilities are available and there is no night travel. A programme of receptions, local sightseeing, and entertainments is being arranged. Among the spas to be visited are: Merano, Carezza (Karersee), and other Dolomite resorts; Riva and Gardone on Lake Garda; Montecatini, and Viareggio. Detailed information can be obtained from the Italian Travel Bureau, 16, Waterloo Place, Regent Street, S.W.1.

ON the occasion of the celebration of the seventh centenary of the foundation of the University of Toulouse, a medical congress will be held on June 8th, when addresses will be given by Professor Bordet of Brussels and Professor Gley and Inspector-General Toubert of Paris.

THE Luigi Devoto Foundation of Milan has offered a prize of 10,000 lire for the best work on industrial pathology.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W.C.1.***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1, on receipt of proofs.

All communications with reference to ADVERTISEMENTS, as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager.

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines).

The ***TELEGRAPHIC ADDRESSES*** are:
EDITOR of the *British Medical Journal, Aitiology Westcent, London.*
FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate Westcent, London.*
MEDICAL SECRETARY, *Mediocra Westcent, London.*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams: *Bacillus, Dublin*; telephone: 62550 Dublin), and of the Scottish Office, 7, Drumsheugh Gardens, Edinburgh (telegrams: *Associate, Edinburgh*; telephone 24361 Edinburgh).

QUERIES AND ANSWERS.

RADIUM IN ARTHRITIS.

DR. F. WILLIAM COCK (Appledore, Ashford, Kent) writes: Can any of your readers inform me if there is information to be obtained of the use of radium for rheumatoid arthritis with somewhat rapid formation of bone in and about the hip-joint?

TREATMENT OF PERICARDITIS.

"B." writes to ask for advice in the treatment of a case of pericarditis of long standing in an elderly but very active man.

NEO-NATAL INTRACRANIAL HAEMORRHAGE.

"M. D." asks whether any reader has noticed intracranial haemorrhage in the newborn child as a sequel to strong pressure applied to the fundus in order to expedite delivery in delay in the second stage of an otherwise normal confinement. He has used this procedure in a considerable number of cases. The full weight of the body was brought to bear through the two palms, and undoubtedly delivery was hastened and the use of forceps avoided in many cases. Three infants, however, showed signs of cerebral damage. One had convulsions, starting six weeks after birth, and continuing occasionally for some months. This child is now mentally deficient. Another had convulsions starting when four months old and lasting for five months. This child also is mentally deficient. The third child showed signs of slow mental development, had pneumonia when 1 year old, and died of meningitis. "M. D." thinks that there may be a connexion between the pressure and the abnormal brains. He has given up pressure entirely, and now uses forceps much more frequently. He believes that this procedure is probably much safer than pressure or unduly long delay.

AXILLARY HYPERIDROSIS.

DR. CATHERINE EVANS (Herne Bay) writes in answer to "D. G.": I have found small doses of *x* rays to be the most efficacious treatment. Eight or ten applications are usually enough, given at weekly intervals.

DR. BLANCHE A. M. HENDERSON (West Hartlepool) writes: "D. G." might find the following helpful. Axillary hyperidrosis is aggravated by constipation, and in women at certain times. It is also made worse by too much clothing; this should be loose, light, and frequently changed. Two outfits should be worn, on alternate days, no garment being worn on two consecutive days. For washing a hot soapy lather should be used, with household ammonia added; both feet and axillae should be washed as frequently as possible. Exposure of the whole skin to sun and air will help. Diet should be plain and light, with plenty of fruit and fresh vegetables. A hot bath at night is to be recommended and a hairwash every week or ten days. The underwear should not be of wool but cotton, which can be boiled.

INCOME TAX.

Purchase of House and Microscope.

"C. F. E." has recently purchased his house for £2,000; it is assessed to income tax Schedule A at £62 10s., and he borrowed £700 of the purchase price at 5½ per cent. What can he now deduct in respect of the house, and, also, of a microscope bought (not by way of replacement) for £70?

*** The only deduction he can make in respect of the house is the proportion one-half or two thirds of the £62 10s. on which he pays the rental tax. No allowance is due for the microscope, unless he can persuade the local income tax authorities to regard it as an item of "plant and machinery" rather than as falling into the category of loose tools.

Renewal of Car.

"E. E. H." inquires whether he can claim for renewal of car on April 4th, 1928, although he was not liable for assessment for the year 1927-28.

*** The cost of renewing a car can be treated as an expense of the year in which it was incurred. If "E. E. H." makes up his accounts to December 31st or March 31st then the transaction on April 4th cannot affect his liability for 1928-29, but it may be otherwise if he makes his accounts up for the year ending April 5th each year. It is immaterial that he was not liable to assessment for 1927-28, provided that the wearing out of the car has been caused by his work as carried on in 1928-29.

Appointment: Car Depreciation.

"A. P." bought a car in April, 1925, for £225 and used it in connexion with work for which he received a salary and a mileage allowance adequate to cover running costs and depreciation. In April, 1927, he transferred to another authority, and then received a smaller mileage allowance and was granted a depreciation allowance for income tax purposes—£22 for 1927-28 and £18 for 1928-29. In March, 1929, he sold the car for £52 and bought a new car for £293. What can he claim for obsolescence?

*** He used the car for four years, in the first two of which the depreciation was covered by a non-assessable allowance, and consequently is entitled, in our view, to one-half of the full obsolescence allowance—that is, ½ (£225—£22 – £18 – £51) = ½ £225 [illegible] £91 = £131 £67.

Depreciation of Car.

"P. W." bought a car in 1928 for £196; he had previously hired a car as [illegible] required. What depreciation allowance should he claim [illegible] for 1929-30?

*** 15 per cent.—or if the local revenue authority agrees, 20 per cent. of £195 will be the appropriate allowance for 1929-30.

For the following year it will be the same percentage of £193 less the amount of the 1929-30 allowance, and so on, the allowance growing less each year.

Depreciation of Motor Cycle.

"N. D. M." bought a motor bicycle in 1920 or 1921 for £110; it was used for a year, and was then put away until 1928, when it was brought into use by his assistant. Can he claim depreciation on this cycle?

*** Yes. The amount of the allowance will be small, because it must be calculated on the basis of annual writing down by, say, 15 or 20 per cent., but it is as well to claim the allowance and to make a point of putting in the (more remunerative) obsolescence allowance when the cycle is replaced—for example, by a small car or another cycle.

LETTERS, NOTES, ETC.

CANE SUGAR IN THERAPEUTICS.

DR. C. G. S. BARONSFEATHER (Bournemouth) writes: For some ten years I have been studying the effect of cane sugar on lung diseases, more especially tuberculosis and "weak chests" in children. I was led to prescribe it frequently, with the best results. The late Dr. Arthur Goulston in his book, *Cane Sugar and Heart Disease*, points out the great value of this simple remedy in cases of weakness of the heart muscle. A sentence in which he sums his conclusions runs as follows: "It is obvious how urgent it is that something be done to lessen the alarming death rate from diseases of the circulatory system. . . . After careful thought I hazard the opinion that in the matter of diet, if more sugar derived from the sugar cane and less sugar derived from beetroot were consumed, we should soon find a satisfactory means of prophylaxis." *It would seem that in pure* Demerara cane sugar we have a valuable and cheap treatment for diseases of the heart and lungs, ailments which form a large proportion of the chronic troubles of the poor. If the Ministry of Health would issue a short printed form to panel doctors, suitable for handing to their panel patients, recommending them to take 3 oz. of cane sugar in hot water daily I think it would go far to settle the grave problem presented by the ever-increasing drug bill. Several simple formulae might be printed on the paper, and once the patient had formed the sugar habit he would not trouble the doctor much more, as I know from experience.

THE TRIANGULAR BANDAGE.

MISS M. L. SPACKMAN (Clitheroe, Lancs) writes: In further reply to "Inquirer" (New Zealand), the triangular bandage used in "first aid" is named after Johannes Friedrich August von Esmarch, the German military surgeon, who was the pioneer of first-aid teaching in Germany, imitating, in 1881, the English St. John Ambulance classes. He wrote a manual, *First Aid to the Injured*, which is based on his lectures, and has been translated into twenty-three languages.

TYPHUS FEVER IN EUROPE.

DURING the war typhus fever appeared first in those countries in which it was endemic, being favoured by famine, overcrowding, and poverty; it was then conveyed by troops, prisoners, and refugees into countries previously healthy. With the termination of the war and the progressive re-establishment of better economic conditions, the disease gradually returned to its former endemic state. J. Laussel has studied the incidence of typhus in Europe since 1914, and has embodied his conclusions in a thesis (*Thèse de Paris*, 1928, No. 427). He states that the incidence of typhus fever in the Balkans, and especially Rumania, is greater now than before the war, and that that country, with Poland and Russia, shows the highest incidence of this infection, though the Russian pandemic—due to the revolution—subsided as the condition of the country improved. Owing to the enforcement of sanitary measures, France remained free from typhus throughout the war, in spite of the arrival of soldiers from the East, the large number of prisoners, and the conditions of life in the trenches. The only epidemic which occurred after the war was at Marseilles in 1919, and here it was confined to the prisons. The outbreak—which was of external origin—was only rendered possible by the fact that the first cases were not recognized; it was soon stamped out by sanitary measures. Laussel adds that the identity with typhus of the recent outbreaks of exanthematous fever on the Mediterranean coast has not yet been established.

PRICE OF INSULIN.

THE British Drug Houses Ltd. and Allen and Hanburys Ltd. announce that the price of "A.B." insulin is to be reduced from 2s. 8d. to 2s., as from May 10th.

VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 50, 51, 52, 53, 56, 57, and 58 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 54 and 55.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 183.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

413. Etiology of Pernicious Anaemia.

A. ENGEL and G. OLIN (*Acta Med. Scand.*, February 28th, 1929, p. 150) remark that the theory of the intestinal origin of cryptogenic anaemia has been accepted generally for nearly thirty years. Dibothriocephalus anaemia closely resembles pernicious anaemia, and toxic substances capable of producing anaemia have been prepared from that parasite. In the great majority of cases of pernicious anaemia the nature and origin of the toxic substance are unknown, though in view of recent clinical and experimental investigations it may be presumed to be of intestinal origin. Several investigators have observed the simultaneous occurrence of pernicious anaemia and intestinal stricture, and that achylia gastrica, almost invariably associated with the disease, frequently precedes it by several years. Pernicious anaemia is always accompanied by pathological changes throughout the entire digestive tract. It has been proved that, though under normal conditions *B. coli* is not found in the stomach, duodenum, or jejunum, in cases of achlorhydria they appear occasionally in the stomach and duodenum, and in pernicious anaemia almost constantly in the stomach, duodenum, and jejunum. The present authors have investigated the production of agglutinins in the blood serum acting upon *B. coli* isolated from the same patient's faeces. They found that, as a general rule, agglutinins were not formed when these organisms were absent from the upper part of the alimentary tract. On the other hand, in gastric achylia and pernicious anaemia *B. coli* agglutinins were found in the blood serum in 17.2 and 55.2 per cent. respectively of the cases examined. Agglutination never occurred in patients who had no *B. coli* in the stomach contents. The authors believe that the occurrence of these agglutinins in the blood in cases of pernicious anaemia is due to the presence of that organism in the stomach and small intestine. They reject the theory of some American authorities that pernicious anaemia is caused by anaerobic bacteria, especially by *B. perfringens* or by certain haemolytic streptococci, and maintain that *B. coli* is the chief if not the only bacterial agent in the etiology of pernicious anaemia. They found no difference in the degree of agglutination between serious and slight cases of pernicious anaemia, nor between recent cases and those which had passed through several remissions.

414. Bell's Facial Paralysis.

C. ROSENHECK (*Med. Journ. and Record*, March 6th, 1929, p. 265) states that, anatomically, a facial palsy may supervene at any point between the cortical origin of the facial fibres to the point of exit at the stylo-mastoid foramen, where the facial nerve divides into several branches to supply the facial muscles. The differences between the central or cortical types of palsies and the peripheral forms (Bell's palsy) are discussed. One diagnostic difference is that in central facial palsies the upper half of the face escapes, while in the peripheral forms the entire face is involved. The former condition is due to the fact that bilaterally acting muscles have representation on both sides of the cortex, so that if disease affects one side the other continues to function. No age is exempt from Bell's palsy, and exposure to wind and cold is usually insisted on by patients as the direct cause. Subjective symptoms are generally inconsequential, the paralysis being the first manifestation, and constitutional symptoms are rare. The degree of involvement is variable, ranging from a mild palsy to a very severe paralysis. The most marked objective symptom is total paralysis of all the muscles on one side of the face, including the forehead and those that close the eye. The electrical response of the paralysed muscles gives valuable information, and there is generally a gradual or total reduction of faradic response with the same phenomena observed with the galvanic current. Very satisfactory results have followed rational treatment; electricity is an important measure, and the type of current that produces contraction in the affected muscles should be employed. The sinusoidal current with its gradual ascent and descent is probably the best. Systematic massage or manipulation of the paralysed muscles and voluntary exercise in reproducing normal movements are of great value. Persistence and patience in treatment are necessary and bring about good results. Rosenheck adds that the haphazard application of electricity should be avoided.

415. B.C.G. Vaccination.

J. A. A. MUÑOYERRO (*Arch. de med., cir. y esp.*, March 23rd, 1929, p. 369) records his observations on 757 infants at the foundling hospital at Madrid who had been inoculated with the Calmette-Guérin bacillus vaccine against tuberculosis. The general mortality was 28.5 per cent., as compared with 35 per cent. among 1,174 infants who did not receive the vaccine, and the mortality from tuberculosis 2.24 per cent., as compared with 4.25 per cent. among the controls. Muñoyerro concludes that, in view of the smaller number of cases of tuberculosis found among the vaccinated, the B.C.G. vaccine is not dangerous. It does not invariably protect against tuberculosis, though possibly in the vaccinated cases in which tuberculosis was found the infection was of intrauterine origin, or so massive in amount that vaccination had no power to control it. The author thinks that before the employment of B.C.G. is generalized or its use made compulsory it should be restricted to maternity hospitals and orphanages, or to patients living in an infected environment, from which the vaccinated subject should be immediately removed.

416. Toxic Jaundice.

K. MOTZFELDT (*Norsk Mag. f. Laegevid.*, March, 1929, p. 283), who records an illustrative case, remarks that different preparations of chinolin, such as atophan and cinchophen, are widely used by the public in the treatment of rheumatic and arthritic pain, and are recommended without restriction in textbooks of pharmacology as being less toxic than the salicylates. During the last two years there have been recorded 25 cases of severe toxic jaundice, including those of Willcox (*Journal*, 1926, ii, 273) and Wells (ibid., 759), 10 of which were fatal from acute yellow atrophy of the liver. Motzfeldt's patient was a woman, aged 27, in whom severe toxic jaundice developed after she had taken a total of 117 grams in two periods during a course of two months for rheumatic pains. Recovery gradually followed.

417. Paroxysmal Sneezing in Pertussis.

H. S. REICHLE (*Journ. Amer. Med. Assoc.*, February 9th, 1929, p. 443), who records two illustrative cases in infants aged 20 and 2 months respectively, states that paroxysmal sneezing may be of great value in the early diagnosis of pertussis, since in young children it may entirely or partially supplant the cough. The attacks are generally convulsive, cause congestion of the head, cyanosis, and exhaustion, and may end in the expulsion of the usual tenacious mucus through the mouth and nose. They may be accompanied by coryza, an inspiratory crow, and vomiting. The few cases seen by Reichle or described in the literature have been moderately severe but not fatal.

Surgery.

418. Arterial Embolectomy.

H. KOSTER (*Amer. Journ. Surg.*, March, 1929, p. 306) believes that the only hope of successful embolectomy lies in early diagnosis and operation, since the mortality rate increases sharply with every hour of delay. As soon as the obstruction occurs secondary thrombosis may begin and so lessen the chances of re-establishing the circulation. Emboli may arise from the heart, the pulmonary veins, the systemic veins, or the arterial tree trunk; no form of heart disease is free from the danger of embolism, the tendency being increased in valvular disease, especially in mitral stenosis. Mural auricular thrombosis occurs often in myocarditis with auricular fibrillation. Thrombus formation depends on platelet accumulation, which develops with circulatory stasis. Thrombosis may be found in both sides of the heart and give rise to simultaneous pulmonary and systemic circulatory embolism with [illegible]tion of the lung and gangrene of an extremity. The [illegible] are sudden severe pain in the affected extremity, [illegible] as the nutrition to the part is lessened; cold an[illegible] are complained of, and there is disturbance of sen[illegible] skin changes colour and becomes marble-white, [illegible] later lividly mottled. The temperature of the li[illegible] skin and tendon reflexes are lost, and pulsation [illegible] the embolus is in a small vessel, without dange[illegible] heat and vigorous massage should be the treatm[illegible] in a large vessel embolectomy should be im[illegible] informed. Spinal block anaesthesia should be [illegible]

it lowers the blood pressure and gives maximal relaxation. The incision should be made below the embolus, and the latter be extracted by gentle massage, the wound being closed by continuous suture. Reports show that of 75 operations within ten hours of occlusion 34 were successful; of 14 between ten and fifteen hours 3 patients recovered; of 13 cases between twenty and thirty hours only 2 patients were cured; and of 9 cases operated on between thirty and forty-eight hours after occlusion only one was successful. No case was successful when forty-eight hours elapsed before the operation. The best ultimate results were in embolism following an operation or parturition without cardiac lesions.

419. Treatment of Intestinal Obstruction.

T. G. ORR and R. L. HADEN (*Annals of Surgery*, March, 1929, p. 354) classify the treatment of acute intestinal obstruction under five headings: removal of the mechanical obstruction; relief of dehydration; treatment of hypochloraemia; relief of starvation; and drainage of the small bowel by an enterostomy. They emphasize the importance of early diagnosis and surgical treatment before change has taken place in the chemistry of the tissues and fluids; but before any operation is undertaken the patient should receive large quantities of water, salt, and glucose, and the total quantity of liquid given during twenty-four hours while the acute stage lasts should not be less than 4 to 6 litres. Water should always be given in the form of salt solution; in the hypochloraemia of intestinal obstruction sodium chloride is an essential part of the treatment, and tends to restore the blood chlorides to normal. By using hypodermoclysis and intravenous injection, 3 to 4 litres of water and 50 to 75 grams of sodium chloride can be given in the 24 hours before operation. After the operation the administration of salt solution should be continued until the patient is out of danger, and glucose should be given intravenously in 10 to 25 per cent. solution at the rate of 0.8 to 0.9 gram of glucose per kilo of body weight per hour. A patient weighing about 11 st. can assimilate 56 to 63 grams of glucose per hour, which furnishes 200 to 250 calories of energy. It is considered that dehydration and hypochloraemia are largely responsible for death in intestinal obstruction. Enterostomy as a preliminary operative treatment is of value in selected cases.

420. Dupuytren's Contraction.

A. C. ABBOTT (*Canadian Med. Assoc. Journ.*, March, 1929, p. 250) reviews the literature and describes a fascial transplantation procedure used in the surgical treatment of Dupuytren's contraction; he believes that this offers in the majority of cases the greatest chance of a satisfactory result. Notes are given of a case in which the contracture followed a forcible dorsiflexion of the right middle and ring fingers, and was unsuccessfully treated by local excision. A second operation with wide excision of all diseased fascia and an immediate transplantation of a piece of fascia lata resulted in complete functional recovery. At this second operation the old scar was excised and the surrounding skin dissected up; all diseased fascia was freely removed, care being taken not to injure the underlying vessels and nerves. A piece of fascia lata fashioned to the shape of the space left by the removal of the abnormal palmar fascia, and overlapping it by about a quarter of an inch, was loosely tacked with plain catgut to the remaining palmar fascia, and the skin was carefully united with interrupted silkworm-gut sutures. The patient was discharged in ten days with an excellent result; two years later all thickening on the palm had completely disappeared, and all movements were perfect, the patient being at work as usual and using a heavy pair of wire cutters. Abbott insists that in transplantation it is important to obtain as fine a piece of fascia as possible, larger than the palmar defect to allow for shrinkage, and that this should be merely tacked in place without tension in order to prevent any portion of it being strangulated by tight sutures; complete haemostasis is essential. The hand should be kept on a splint for a fortnight, and work be avoided for three months in order to prevent all source of irritation; light work is advisable for a further three months. In the more severe types of contractures, with considerable skin involvement and the possibility of sloughing, skin [illegible] might be necessary.

422. Clinical Aspects of Cystitis.

A. E. SCHIMER (*Minnesota Med.*, March, 1929, p. 160) insists that successful treatment of cystitis is impossible without a comprehensive diagnosis, a thorough clinical examination being essential. Cystitis may be the first sign of an associated pathological condition in the urinary organs, treatment of which will cure the bladder infection. While the normal bladder wall possesses a high degree of immunity to bacteria, interference with its emptying will predispose to infection, which may result from chemical irritation, bacterial infection, animal parasites, yeasts, or fungi. Every possible focus of infection, including the teeth, tonsils, appendix, gall-bladder, and prostate, must be eliminated.

Therapeutics.

423. Phenylhydrazine in Polycythaemia Vera.

SINCE very little is known about the pathogenesis of polycythaemia vera, except that the erythroblastic bone marrow usually shows hyperplasia, treatment has been solely symptomatic and directed either to reducing the number of red cells or to inhibiting their formation. S. H. HURWITZ and J. LEVITIN (*Amer. Journ. Med. Sci.*, March, 1929, p. 309) report a case treated with phenylhydrazine; they emphasize the value and dangers of this drug, and suggest certain criteria for the control of its dosage. Phenylhydrazine is a powerful protoplasmic poison, causing extensive fatty degeneration of the liver and marked destruction of erythrocytes, and resulting in a reducing effect on haemoglobin. It is given orally in capsules, and the following plan of treatment is recommended as being safe. Guided by frequent blood examinations, 0.2 gram may be given for three or four days. The dose is then reduced to 0.1 gram daily until the leucocytes increase in number or the haemoglobin falls below 100 per cent. When this occurs 0.1 gram may be given every second or third day, or the drug be discontinued, the latter course being probably the safer. It has been stated that about 0.1 gram once a week in the average case will keep the red count within normal limits. The authors found that phenylhydrazine produces definite clinical improvement in polycythaemia vera, and that, guided by frequent counts of the red and white blood corpuscles and by estimations of the serum bilirubin, it may be given without danger. Its administration should be stopped before the red blood count reaches a normal level, as the action continues after its withdrawal. The haemolytic crisis observed by the authors and others may be avoided if additional safeguards be used. Because of the great difference in the response of patients to varying amounts of the drug, quantitative estimations of the serum bilirubin and leucocyte counts should be frequently made. A marked rise in the amount of the former means excessive blood destruction, whereas a rising leucocyte count probably indicates great destruction of liver cells. The use of phenylhydrazine is no exception to the general observation that the various measures used in polycythaemia vera are transitory, and the effect produced purely palliative. Whatever therapeutic measures are adopted, there is a tendency for the erythrocyte count to rise and for subjective symptoms to return.

424. Treatment of Tetany in Infants.

H. BAKWIN, RUTH BAKWIN, and GERTRUDE GOTTSCHALL (*Amer. Journ. Dis. Child.*, February, 1929, p. 311) divide therapeutic agents useful in tetany into two groups: (1) substances such as calcium chloride and parathyroid extract, which effect an immediate but transient rise in the serum calcium, and (2) those with a slower but more lasting effect—namely, ultra-violet radiant energy, irradiated cholesterol, and irradiated ergosterol, this last being the most rapid in its action. In a series of twenty cases the administration of 4 mg. daily caused the serum calcium to rise to normal in an average of seven days. Ultra-violet radiant energy was as constant in its action, but took twice as long. Irradiated cholesterol was still slower and less constant. Cod-liver oil was found to be inadequate, its action being too slow and inconstant. The treatment of choice appears to be a combination of calcium chloride, which has a marked immediate effect on the serum calcium, and irradiated ergosterol; the calcium salt is given in large doses (15 grains) at intervals of one or two hours during the first few hours. The daily dosage of ergosterol was 3/50 grain, and it was not ascertained whether larger doses would have acted more rapidly.

425. **A Calcium-Stovarsol-Phosphate Preparation.**

A. A. LEVY (*Med. Journ. and Record*, March 6th, 1929, p. 279) draws attention to the therapeutic possibilities of a recently elaborated combination representing the calcium salts of stovarsol (calcium acetylamino oxyphenylarsenate) and of phosphoric ether of glucose (calcium glucophosphate), discovered in 1926 by Sabatay of the Pasteur Institute. From the interlocking, synergistic, and "balance" action of the three constituents, it was considered that this new preparation, named "realphene," might prove to be of considerable value in those disturbances of metabolism or deficiency conditions in which these constituents were formerly prescribed. Favourable results were also expected in debilities of syphilitic origin and in parasitic infections amenable to stovarsol treatment. Levy reports marked benefits from its administration in the following groups of cases: stomatitis with anorexia and loss of weight; convalescence; secondary anaemia; syphilitic cases; under-nourished children; asthenic adults; and cases of tuberculous diathesis. The preparation is granular and of a not unpleasant chocolate flavour; it contains 5 cg. of the stovarsol salt and 2 cg. of calcium glucophosphate in each drachm. The doses are one level tablespoonful for children and one heaped tablespoonful for adults; they are taken three times a day in a glass of milk. Levy considers that this preparation is of definite value as a metabolic synergist in improving assimilation and nutrition in convalescence and deficiency conditions.

426. **Quinine Injections in Lobar Pneumonia.**

L. H. VAN DER VELDE (*Nederl. Tijdschr. v. Geneesk.*, February 16th, 1929, p. 821) records his observations on cases of lobar pneumonia treated by intragluteal injections of quinine hydrochloride. The dosage is as follows: for infants aged 1 to 12 months, 60 to 80 mg.; between the ages of 1 and 2 years, 100 to 140 mg.; from 2 to 5 years, 140 to 200 mg.; from 10 to 15 years, 300 to 400 mg.; 15 years and over, 500 mg. The favourable action of the injection is described as very striking. Rapid fall of temperature ensues, accompanied by improvement of the general condition and a recovery of appetite. The great advantage of the treatment is said to be the remarkable fall in the death rate, the case mortality, which is otherwise about 25 per cent., falling from this to 5 or 6 per cent. To avoid the pain caused by the injection the quinine may be combined with urethane in doses of 250 mg.

Dermatology.

427. **Scleroderma Treated by Insulin.**

O. MICHAELIS (*Brux.-Med.*, March 17th, p. 560) describes fully a case of generalized scleroderma. When the patient was first seen the disease had lasted six months. The lower half of the body was less affected than the upper, but the hardening had proceeded so far that side-to-side movements of the head had become almost impossible, and the patient could not ring a door bell without tilting the whole trunk backwards. In taking the blood for a Wassermann test great difficulty was experienced in penetrating the pachydermatous skin. In spite of the Wassermann reaction being negative antisyphilitic treatment was tried, but without result, and thyroid extract was similarly ineffective. The patient presented one constant symptom of Raynaud's disease—namely, blueness of the fingers on cold damp days. Since the possibility of there being some association between Raynaud's disease and scleroderma had been suggested, and as insulin had been effective in a case of Raynaud's disease, it was determined to try a course of insulin in this case, combined with ultra-violet radiations for the asphyxia of the hands. At the end of six months there was a relaxation and a softening of the tissues. Progress was very gradual, and is expressed by the authors as "three steps forward, two steps back." At the end of a year's treatment the condition was so much better than at the beginning that the author was hopeful of a complete [illegible] would persevere with the same what [illegible]

428. **[illegible] the Limbs.**

L. [illegible] *and Syph.*, March, 1929, p. [illegible] "erythrodermia" is a definite [illegible]on and persistent "eczema" [illegible] of a purely neurotic origin. It [illegible]c red, scaling, often moist and [illegible]orearms or legs, or both, of sharply [illegible]ay other skin disease, and strikingly [illegible]terical "glove and stocking" anaesthesias. The [illegible]ion never extends lower than the dorsum of the foot nor higher than a line just below the patella; in the forearm it is limited by the elbow-joint above and the wrist below, only occasionally spreading to the back of the hand as far as the webs of the fingers. In long-standing cases this distribution is maintained, though usually only on the legs, where the skin has a leathery, shiny, lichenized appearance. In one of the author's cases both legs were affected for twenty years, and yet even such long-standing cases present nothing bacteriologically beyond the normal cutaneous flora without any subsequent scarring, while the general health is unimpaired. The patients are of the type of constitutional neurotics with a typical melancholic facies resembling that of anxiety neurosis, a lined face, wrinkled forehead, tremulous lips, and staring eyes. Treatment should be directed mainly at preventing the habit of rubbing and scratching, which induces and maintains the condition. Sedatives and hypnotics such as luminal or bromides are given to induce sleep and allay the irritation. Bland lotions or small doses of x rays are applied locally for their antipruritic action; malachite green paint may be used for its effect on the imagination; well-applied occlusive dressings can be relied on. After protecting the affected part with a layer of sterile gauze, plaster bandages incorporating Unna's zinc and gelatin paste may be applied. Notes of sixteen cases with descriptive photographs are given.

429. **Liquid Oxygen in Dermatology.**

H. G. IRVINE and D. D. TURNACLIFF (*Arch. Derm. and Syph.*, February, 1929, p. 270) advocate the use of liquid oxygen in the treatment of warts, naevi, seborrhoeic keratosis, lupus vulgaris, skin tuberculosis, and small epitheliomata. The authors state that liquid oxygen can be obtained commercially and will keep for several days stored in Dewar flasks; it can be applied with a saturated swab of cotton-wool on an ordinary wooden applicator. This is maintained on the lesion without pressure until it freezes, and by taking care to avoid the surrounding skin little pain results, since it is only when the liquid spreads beyond the lesion and freezes the normal skin that considerable pain is caused. The authors record successful results in the treatment of warts (22 cases), herpes zoster (5 cases), seborrhoeic keratosis (7 cases), small pigmented and papillomatous moles (3 cases), and small raised vascular naevi (4 cases). They conclude that the treatment is more rapid and less painful than with the electric needle, and that for this reason it is specially useful in children, while the cosmetic results are excellent.

Obstetrics and Gynaecology.

430. **Treatment of Uterine Fibroids.**

REEB (*Bull. Soc. d'Obstet. et de Gynécol.*, February, 1929, p. 153) utters a warning to those enthusiasts who consider that treatment by radium or x rays is invariably effective for uterine fibromata. The fact that treatment by radiation avoids both the immediate and remote risks of operation has caused this method of treatment to be popular. The author considers that radiation treatment fails not infrequently, and that it may even be dangerous, as when the fibromata are complicated by affections of the adnexa. There is also the danger that all genital functions may be suppressed in a young woman. The duty of deciding which cases should be submitted to radiation treatment devolves upon gynaecological surgeons. Reeb maintains that radiation should never be employed [illegible] is uncertain. The three principal [illegible] he considers, are the following: [illegible] by purulent tumours of the adnexa; peritonitis may be precipitated by the treatment. (2) Adenomyomata; it is known that radium has but little effect on cylindrical-celled neoplasms of the cervix and body, and it may be deduced that glandular new growths with the cylindrical epithelium of an adenomyoma may be equally refractory to radiations. (3) Submucous fibromata; patients with such growths, after treatment by radiations, not infrequently appear on the operation table. Radiologists claim that submucous fibromata can be cured by radiations. Probably the difference of opinion lay in the difficulty of arriving at a correct diagnosis. To obtain the best results collaboration between gynaecologist and radiologist is essential.

431. **Spontaneous Rupture of Pyosalpinx.**

S. DI PALMA and M. M. STARK (*Surg., Gynecol. and Obstet.*, March, 1929, p. 419), who have collected thirty-four cases, including one which came under their own observation, state that spontaneous rupture of a pyosalpinx into the urinary bladder is very rare. The symptoms are very characteristic, consisting of sharp pelvic or suprapubic pains, the appearance of large quantities of pus, often foul-smelling, in the urine, a relief of urinary and vesical symptoms, and a decided improvement in the patient's general condition. The diagnosi

PUBLIC NOTICE

re

"RYVITA CRISPBREAD"

and

"THE RYVITA CRISPBREAD HABIT"

We acknowledge with much pleasure and grateful thanks the volume of congratulations on our successful introduction of "Ryvita Crispbread" to the British Isles.

When we gave to the British public this new and invaluable food—creating throughout our country the *Ryvita Crispbread habit*—we started what has now become almost a revolution in the bread-eating habit of the nation.

"Ryvita Crispbread" is the successful outcome of generations of experience directed to making just this one thing *right*.

That it is, and does, all that we claim for it is proved by the welcome it has received from Doctors, Dentists, and food experts, who not only prescribe it but have it as the daily bread in their own homes

Because of its success, not only with the professions and the experts, but with the ordinary folk of these islands, there have arisen a number of "imitation Crispbreads." Some of these are not bad—*as imitations*—some are bad, some quite bad.

We make "Ryvita Crispbread" in Sweden because this type of bread is essentially and characteristically Swedish. The special ovens which we use are a mere item compared with the skill and long experience needed to make Ryvita *right*. It has taken generations of experience devoted exclusively to making just this type of bread to win the present perfection of "Ryvita Crispbread."

Although we make "Ryvita Crispbread" in Sweden, we who own and control the Ryvita Company are British. We buy British when it is best. But, like most other British people, we *will* have the best.

When we smoke a cigar it must be—Havana made in Cuba. After dinner, when we offer our friends a glass of port—it must be port from Portugal. When we have a little party, our champagne must be genuine from France. The suggestion that you should buy imitation Crispbreads merely because they are "British made" is as ludicrous as it would be to claim pre-eminence for British Cigars—British Port—or British Champagne.

Whilst the Ryvita Company is proud of its achievement in popularising the healthful *Ryvita Crispbread habit* in this country, it entirely dissociates itself from these hastily prepared substitutes.

The genuine original "Ryvita Crispbread"—crisp, scrunchy, and delicious . . . the bread of life and health—helps to make indigestion, constipation, malnutrition, and obesity unknown.

"Ryvita Crispbread" is sold by all good grocers and stores at 1/6 per 40–50 slice (1 lb.) carton; ½ lb. carton, 10d.

THE RYVITA COMPANY

DOCTORS prescribe "ARDENTE"

because they know it is fitted from a wide range of distinct types—very inconspicuous—devoid of extraneous buzz—true-to-tone for conversation, music, church, theatre, public and school work. They also know that the guaranteed "Ardente" carries a genuine "after-sale-service"

for their DEAF patients

Every important Medical Journal in the land has commended Mr. R. H. DENT'S world-famous aid for its efficiency and simplicity, and, if greater proof were required, it lies in the fact that

many DEAF DOCTORS use "ARDENTE"

"ARDENTE" STETHOSCOPE.—Mr. R. H. Dent also makes a stethoscope specially for members of the medical profession suffering from deafness, slight or acute. Many are in use, and excellent results are reported.

SALTAIR SURGICAL SERVICE

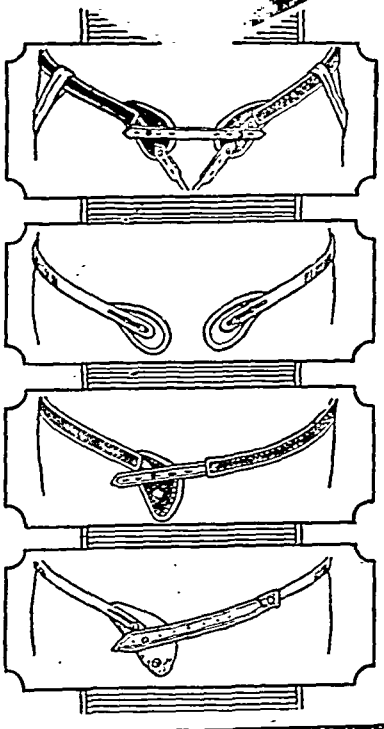
SALTAIR SURGICAL SERVICE

Guarantee

"We guarantee to alter, exchange, or accept the return of any appliance without cost, ordered by the Medical Profession, if not found suitable within fourteen days from date of supply."

Salt and Son Ltd.

The Medical Profession with the aid of Salt's Surgical Service CAN (except in cases of gross carelessness on the Patient's part) PREVENT future cases of SEVERE HERNIA and greatly alleviate those already existing.



EFFICIENT TRUSSES BY POST

In many instances the Medical Man is faced with the impossibility of sending his patient to a skilled Truss **Maker** on the grounds of ill health, absence from employment, or cost of travelling.

Saltair Surgical Service has overcome this difficulty by fitting a patient with an **"Efficient Truss"** to his own doctor's prescription.

The special order forms we supply give us sufficient information, even in difficult or abnormal cases, to supply a spring of correct strength and shape, to cover and pad it as required, and to fit an adjustable pad of the correct size and shape. Hence, we supply by post to the doctor a Truss which is an accurate interpretation of his prescription.

THE CIVIL SERVICE CO-OPERATIVE TRUST, LIMITED.

Directors:
Sir HENRY J. GIBSON, K.C.B. (Chairman), late Comptroller and Auditor General.
D. H. BOGGIS-ROLFE. Major L. Sr. JOHN COLLEY. A. CARSON ROBERTS. J. CLIFFORD ROWE, J.P. Mrs. A. SAMSON.
Auditor: Sir GILBERT GARNSEY, K.B.E. (Public Auditor, appointed under the Industrial and Provident Societies Act, 1893).
Bankers: BARCLAYS BANK, LIMITED.

You are invited to become a Shareholder of this Investment Trust. As its title implies, it was formed with the particular view of providing a sound medium for the investment of the savings of Civil Servants, but there is no restriction of class, and any person may become a Member. A number of Medical Practitioners are Members.

This Trust possesses a Board of Directors which should give the Members complete confidence that there is no unsound treatment or waste of funds. It includes men of experience and distinction in finance, in the special work of Investment Trusts, the investigation of securities and accounts, and the advising of Companies, Trustees and individual investors upon their investments.

The Civil Service is represented by three men who have held the leading posts in the audit and supervision of our National, Local Government, and National Insurance accounts respectively.

As in the case of any good scheme for combined investment, the Trust provides for a good return and the prospect of an increasingly high yield with a degree of safety not obtainable by direct investment. The funds are invested in a large number and great variety of securities. The individual Shareholder, therefore, in respect of his one small holding is effecting a sort of insurance by spreading his risks over a large number of concerns.

No deduction of Income Tax is made from the dividends. Hence Shareholders are freed from the trouble and the risk of loss connected with tax reclaims. Shareholders liable to make Income Tax returns must of course disclose these dividends.

The Shares of the Trust are all of one class and of 2s. denomination with 1d. a share entrance fee. The smallest subscription allowed is of 10 shares, costing £1 0s. 10d., and the largest of 2,000 shares, costing £208 6s. 8d. Any sum between these two limits may be subscribed at the same rate in units of £1 0s. 10d. (10 shares), until the entrance fee is raised. Investment at the minimum rate is still available. Shares rank for dividend as from the first day of the month following the date on which they are allotted.

The Board is prepared to facilitate the sale of any shares of which a Member may desire to dispose so that the seller may, so far as practicable, benefit by any enhanced value.

THIS APPLICATION FORM MAY BE USED. (15)

To the Directors of THE CIVIL SERVICE CO-OPERATIVE TRUST, LIMITED,
341, WINCHESTER HOUSE, LONDON, E.C.2.

I, the undersigned, hereby apply for.....Shares of 2s. each in the above-named Trust, subject to the Rules of the Trust. I enclose a remittance for £.....s.....d., being payment in full for such Shares, together with an entrance fee of 1d. per Share, and I agree to hold the same or any lesser number which you may allot me.

KROME-PLATE SURGICAL INSTRUMENTS

GIVE LONG LIFE AND RELIABLE SERVICE

DONIGER Krome-Plate Surgical Instruments have proved their definite superiority over ordinary nickel-plate. They are manufactured by highly specialized craftsmen from pore-free high carbon steel. After being polished until they are perfectly smooth and bright, then they are nickel-plated in the usual way, and finally given a heavy plating of chromium. This special process makes Doniger Instruments:

(a) much harder and stronger;
(b) rust-resisting;
(c) last five times as long as nickel;
(d) retain their original brightness.

Doniger Instruments have been tested over and over again in large hospitals and clinics in America and have always given complete satisfaction. In spite of their many advantages they cost very little more than ordinary nickel-plated instruments.

You are invited to apply to your usual Supply House for full particulars and prices.

Doniger Instruments are not supplied direct to the Profession.

System II.

BELT FOR GENERAL SUPPORT.

Pre-eminently useful after confinement, affording the most effectual support to the internal organs, preventing pressure on the fundus of the womb. System II should be used in all cases where the abdominal muscles need support. It also invariably gives good results in cases of enteroptosis, gastroptosis, and all similar troubles.

THE POSTAL ACCOUNT

It is often supposed that to live a long way from the nearest branch of a bank, or to be constantly unable to go to the bank in person, is a handicap to the enjoyment of the full advantages which, it is admitted, a banking account offers. Perhaps it is assumed that to conduct an account by post involves 'more letter writing', or is costly, or is not welcomed by the Bank. It is the aim of the Westminster Bank to dispel such misconceptions by a leaflet entitled *The Postal Account*, which explains the convenience of the method, and offers some clear suggestions.

The Secretary of the Bank will be pleased to send a copy on application

NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary Boarders, persons suffering from incipient nervous and mental disorders, as well as certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients and voluntary boarders can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical baths, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The Seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Voluntary Boarders or Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (*Telephone*: No 56 Northampton), who can be seen in London by appointment.

THE COPPICE, NOTTINGHAM.
HOSPITAL FOR MENTAL DISEASES.

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Voluntary Boarders received without Certificates.

For terms, etc., apply to the Medical Superintendent.

HAYDOCK LODGE,

HARROGATE

is one of the finest SPAS and HEALTH and PLEASURE RESORTS in EUROPE.

AS a HEALTH and PLEASURE RESORT it is famed for its remarkably pure and bracing air, its fine shops and residences, its open spaces, parks, high-class amusements and entertainments, and last, but not least, its ideal situation as the centre of some of England's most glorious countryside.

As a SPA it claims supremacy over all the Spas of the world by virtue of having no fewer than 88 different mineral waters, and a most elaborate and completely equipped Bathing Establishment, with a Staff of upwards of 200 Medically Trained and Medically Certificated male and female *Nurses. It is really a compendium of the World's Spas.*

Cases treated with benefit comprise:

(1) Gout and other metabolic disorders (glycosuria, obesity).
(2) F[illegible] early and
(3) Chronic skin diseases of all kinds.
(4) Synovitis, fibrositis, sciatica, and other *forms of neuritis.*
(5) Arthritis (rheumatoid, chronic rheumatic, and toxæmic varieties).
(6) Mucous colitis, chronic dysentery, constipation, and intestinal toxæmias.
(7) Anæmia in its various forms.
(8) Nervous diseases (neurasthenia and hysteria).
(9) Hyperpiesis.
(10) Sequelæ of tropical diseases, especially anæmia.

***Pullman and Fast Restaurant Car Trains** daily from King's Cross Station, London. Members of the Medical Profession are asked to write for particulars of Complimentary Facilities to F. J. C. BROOME, General Manager, 38, The Royal Baths, Harrogate.*

UNIVERSITY of CAMBRIDGE.

DIPLOMA IN MEDICAL RADIOLOGY AND ELECTROLOGY (D.M.R. & E.).

The Course of study for the Diploma, which is open only to duly qualified medical men and women, begins on October 1st, 1929, and occupies nine months. The examinations consist of three parts:

1. Physics, with examinations in January and April.
2. *Radiology and Electrology*, with examinations in April and July.
3. The presentation of a thesis or exercise which is entirely the candidate's own work, and is intended to show that he has had practical experience of the subjects.

The first three months may be spent either in Cambridge, where the Physics is done in the Cavendish Laboratory and the *Radiology* and Electrology in a specially equipped Department of Radiology, or in London, where the Physics is done in the Laboratories of the Middlesex Hospital and King's College and the *Radiology and Electrology* is taught at the British Institute of Radiology. These Courses run concurrently in Cambridge and London.

The second three *months* must be spent in London, where courses of lectures are given at the British Institute of Radiology, and are combined with *clinical* instruction in the large teaching hospitals.

The third three months may be spent in recognized hospitals in London or elsewhere, the student acting as clinical assistant or in similar capacity.

Further information as to the Courses may be obtained from:

G. STEAD, M.A., Secretary for the Diploma, and *Lecturer* in Physics as applied to Medical Radiology, Cavendish Laboratory, Cambridge.

A. E. BARCLAY, O.B.E., M.A., M.D., Lecturer in Radiology, Department of Radiology, *Medical School*, Cambridge.

The Director of the British Institute of Radiology, 32, Welbeck St., London, W.1.

UNIVERSITY OF CAMBRIDGE

Diplomas in (a) PUBLIC HEALTH, (b) HYGIENE (for foreign graduates), (c) TROPICAL MEDICINE AND HYGIENE.

The Municipal Commissioners of Singapore require a lady Assistant Municipal Health Officer for their permanent staff, the appointment being in the first instance upon a three years' agreement.

Candidates should be between 25 and 35 years of age, and unmarried. Candidates must be Graduates in Medicine and Surgery of one of the British Universities, or must hold the qualifications of the College of Surgeons and Physicians of London, Edinburgh, or Ireland. They must also hold a registrable qualification in Public Health. Candidates will also be expected to have had at least three years' experience of the practical and administration side of Infant Welfare work and control of Midwives in a large town, as the selected candidate will be required to take charge of this branch of the Municipal Health Department.

The selected candidate must pass a medical examination as to her fitness for service in the Tropics.

Salary $8,400, $8,800, and $9,360 respectively for the three years of the agreement, rising thereafter, if service be continued, to a maximum of $12,000 per annum. The exchange value of the dollar is 2/4 sterling, at which rate the initial salary of the appointment is £960 per annum. There is no Income Tax at present.

Free first-class passage with half-pay on the voyage out will be provided, and a return passage on satisfactory completion of the agreement (if not renewed) provided that the officer returns to England forthwith. An allowance for the maintenance of a private motor car for use on duty will be granted. Should the officer continue in the service after completion of the agreement, six months' leave on full pay, with passage paid, will be granted after three years' service. Liberal Provident Fund.

The population of Singapore is about 400,000, and the day temperature about 80° to 90° F.

Applications, giving age and birthplace, with details of education, training, and experience generally, and referring particularly to the qualifications mentioned above, and accompanied by copies (not originals) of testimonials, to be lodged with Messrs. PEIRCE & WILLIAMS, M.M.Inst.C.E., 64, Victoria Street, S.W.1, Agents for the Commissioners, not later than Thursday, May 9th.

Further particulars, if desired, can be obtained from the Agents.

University of Durham College
OF MEDICINE,
NEWCASTLE-UPON-TYNE.

PUBLIC HEALTH LABORATORIES and BACTERIOLOGICAL DEPARTMENT.

Applications are invited for the post of Whole-time ASSISTANT. Applicants must be registered medical practitioners with experience of Public Health Bacteriology and Clinical Pathology. In addition to work in the Public Health Laboratories, the Assistant will be required to take part in teaching.

Commencing salary £400 per annum.

Applications, with copies of three recent testimonials, should be submitted to the Registrar, University of Durham College of Medicine, Newcastle-upon-Tyne.

County Borough of Birkenhead.

MEDICAL OFFICER'S DEPARTMENT.

ASSISTANT MEDICAL OFFICER (Resident).

Applications are invited for the above appointment from duly qualified men (unmarried) holding a Diploma in Public Health.

The appointment carries with it a salary of £450 per annum, residence at the Infectious Diseases Hospital, board and washing.

The successful candidate will be required to pass a medical examination, and a deduction of 5 per cent. will be made from salary towards the Council's Scheme under the Local Government and Other Officers Superannuation Act, 1922.

He will be required to undertake the treatment of patients in the Hospital, to assist at the Municipal Venereal Diseases Clinic, and to carry out such other duties as may be assigned to him by the Medical Officer of Health.

Canvassing members of the Town Council, either directly or indirectly, will disqualify.

Particulars of the appointment and form of application may be obtained from D. MORLEY [illegible], M.A., M.D., Medical Officer of Health, 9, Hamilton Square, Birkenhead.

Applications must be received not later than [illegible]

Town Hall, Birkenhead. E. W. TAME, Town Clerk.

County Borough of Croydon.

PUBLIC HEALTH DEPARTMENT.

ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

Applications from qualified medical practitioners are invited for the appointment of an Assistant Medical Officer of Health and Assistant School Medical Officer.

Applicants must be medical men holding a special qualification in State Medicine or a Diploma in Public Health, and must have had three years' experience of the practice of medicine since obtaining their medical qualification.

Preference will be given to applicants who

(i) Have had some definite experience of school medical work;
(ii) Have enjoyed special opportunities for the study of diseases in children;
(iii) Have had experience in infectious diseases; and
(iv) Have held one or more resident hospital appointments.

The candidate appointed will be required to produce a recent satisfactory medical certificate of health and to devote the whole of his time to the duties of the office. The appointment is subject to three months' notice of termination on either side.

The salary will be £600 per annum.

Applications, to be made on forms to be obtained by sending a stamped addressed foolscap envelope to the Public Health Department, Town Hall, Croydon, with copies (not originals) of not more than three testimonials of recent date, not later than 10 o'clock in the forenoon of Monday, May 13th, endorsed "Assistant Medical Officer of Health."

Canvassing in any form is prohibited.

Town Hall, Croydon. JOHN M. NEWNHAM, Town Clerk.

April 22nd, 1929.

Romford Union.

OLDCHURCH HOSPITAL.

RESIDENT THIRD ASSISTANT MEDICAL OFFICER.

The Guardians of the Romford Union invite applications for the appointment of a Third Assistant Resident Medical Officer (male) at their Oldchurch Hospital, Romford, which has a present accommodation of 650 beds. The Hospital is situated 12 miles from London.

Applicants must be single, and preference will be given to one who has held the position of House Surgeon or House Physician in a General Hospital.

The appointment is governed by the regulations laid down in the orders of the Ministry of Health.

The salary will be at the rate of £250 per annum, subject to deductions under the Poor Law Officers Superannuation Act, 1896, with furnished apartments, maid, rations, and laundry.

Forms of application may be obtained from the undersigned upon receipt of a stamped addressed foolscap envelope, and must be returned not later than Monday, May 13th.

By Order,

Union Offices, Romford. R. H. MASON, Clerk to the Guardians.

April 25th, 1929.

Parish of Lambeth Board of GUARDIANS.

Wanted, Male JUNIOR ASSISTANT MEDICAL OFFICER for the LAMBETH PARISH HOSPITAL (including lying-in wards) and for the out-relief districts of the parish administered therefrom. Applicants must be fully qualified and have recently held a resident appointment at a recognized teaching school. The work is arranged so that a wide experience may be obtained by the officer appointed.

Inclusive salary £200 per annum, payable monthly, together with residential emoluments, valued at £150 per annum. The person appointed will be required to repay to the Guardians any fees whatsoever received by him by virtue of the office held.

Written application to be sent to the Clerk to the Guardians, Guardians' Offices, Brook Street, Kennington, S.E.11, and to arrive not later than by the first post Saturday, May 11th.

Papworth Village Settlement,
near CAMBRIDGE, for the Treatment of all forms of Tuberculosis.

Applications are invited for the post of HOUSE PHYSICIAN. Applicants should be male and single. The appointment is for six months, with prospects of advancement to a higher position on the staff. Salary £100 to £200 per annum, according to previous experience, with board, lodging, and laundry.

Apply to Medical Director, Papworth Hall, Cambridge.

Borough of Ilford.

APPOINTMENT OF ASSISTANT SCHOOL DENTAL SURGEON.

The Ilford Borough Council invite applications from registered Dental Surgeons of either sex holding a degree or diploma in Dental Surgery for the above appointment.

The inclusive salary of the office will be at the rate of £450 per annum.

The duties of the officer appointed will be mainly connected with the dental inspection and treatment of school children, but the successful candidate will be required to assist when necessary with the other dental services of the Council.

The person appointed will be required to devote his or her whole time to the duties of the office, to reside within the Borough, to work under the general supervision of the Medical Officer of Health of the Council, and to enter into a contract with the Council for the due performance and fulfilment of the duties and conditions of the appointment.

The appointment will be subject to the Staff Regulations of the Council, and the successful applicant will be required to pass a medical examination.

Candidates must not be more than 45 years of age.

Applications, which must be made on forms obtainable (with list of duties) from the undersigned, accompanied by copies of three recent testimonials (which will not be returned) and endorsed "Dental Surgeon," must be received at my office at the Town Hall, Ilford, not later than noon on Monday, May 13th.

Canvassing members of the Council or Education Committee, directly or indirectly, is prohibited and will disqualify.

By Order,

Town Hall, Ilford. ADAM PARTINGTON, Town Clerk.

April 24th, 1929.

Borough of Folkestone.

APPOINTMENT OF ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited from duly qualified gentlemen for the position of Assistant Medical Officer of Health and Port Medical Officer, at a salary of £600 per annum. Candidates should have previous experience in a similar capacity.

The gentleman appointed must possess the qualifications prescribed by the Sanitary Officers Order, 1926, and will be required to devote the whole of his time to the duties of the office. He will also be required to assist in the duties of Medical Inspection of Aliens.

The post is designated under the Local Government and Other Officers Superannuation Act, 1922, and the appointment will be made subject to medical examination.

Applications, stating age, qualifications, and experience, accompanied by not more than three recent testimonials, and endorsed "Assistant Medical Officer of Health," should be addressed to me and delivered at my office not later than May 18th.

Town Clerk's Office, Folkestone. C. F. NICHOLSON, Town Clerk.

April 30th, 1929.

Parish of Southampton.

SECOND RESIDENT ASSISTANT MEDICAL OFFICER.

The Guardians of the above Parish are desirous of receiving applications for the appointment of a SECOND RESIDENT ASSISTANT MEDICAL OFFICER of the Parish Infirmary, Shirley Warren, Southampton, at a salary of £275 per annum, increasing by £10 yearly until a maximum of £350 per annum be reached, with apartments, rations, washing, and attendance, subject to the provisions of the Poor Law Officers Superannuation Act, 1896.

Applications to be made upon forms to be obtained from the undersigned, and must be returned on or before May 11th.

By Order,

Guardians' Offices, Southampton. A. J. WALDEN, Clerk to the Guardians.

April 26th, 1929.

Metropolitan Asylums Board.

The Board [illegible] the appointment of [illegible] MEDICAL OFFICER [illegible] Service. Commencing salary £650, rising by £32 10s. per annum to £800 per annum. Candidates must be under 40 years of age, and must have had previous Mental Hospital experience.

Preference will be given to those holding the Diploma in Psychological Medicine.

Forms of application may be obtained by sending stamped addressed foolscap envelope to the Clerk to the Board, Metropolitan Asylums Board, Victoria Embankment, E.C.4, to which they should be returned not later than May 13th.

ALLAN POWELL, Clerk to the Board.

WEST AFRICAN MEDICAL STAFF

VACANCIES exist for MEDICAL OFFICERS and MEDICAL OFFICERS OF HEALTH in the BRITISH WEST AFRICAN COLONIES.

SALARIES.

Medical Officers receive salaries at the rate of £660 a year, rising by annual increments of £30 to £720 a year, and then on confirmation £720 a year, rising by annual increments of £40 to £960 a year, together with a seniority allowance (payable only in West Africa) at the rate of £72 a year. After three years' service on £960, the salary may be raised to the scale of £1,000 a year, rising by annual increments of £50 to £1,150 a year, together with a seniority allowance at the rate of £100 a year.

Medical Officers of Health receive salary on the above scale beginning at £800 a year, together with seniority allowance of £72 a year. They also draw staff pay at the rate of £150 a year, half of which is payable during leave.

QUARTERS.

Free furnished quarters are provided or an allowance in lieu.

OUTFIT ALLOWANCE.

An outfit allowance of £60 is granted on first appointment.

PASSAGES.

Free first-class passages are provided on first appointment, and when proceeding on or returning from leave.

PENSIONS.

All appointments are pensionable; a minimum service of seven years is required to qualify for a pension. An officer may retire on reaching the age of 50 and may be called upon to retire at the age of 55. Officers of the West African Medical Staff are permitted to retire if they wish with a gratuity of £1,000 or £1,250 after nine or twelve years' approved service respectively, but in that event they receive no pension.

TOURS OF SERVICE AND LEAVE.

A tour of service in West Africa lasts from twelve to eighteen months at the discretion of the Colonial Government, and is followed by leave at the rate of one week for each completed month of residential service. Leave begins on the date of arrival in England.

PROMOTION.

There are good prospects of promotion in the West African Medical Staff.

COURSE OF INSTRUCTION.

Selected candidates are required to attend courses of instruction in tropical medicine and hygiene at either the London School of Hygiene and Tropical Medicine or the Liverpool School of Tropical Medicine or the University of Edinburgh.

Further information regarding the conditions of service, pensions, etc., may be obtained from the Private Secretary (Appointments), Colonial Office, 2, Richmond Terrace, Whitehall, London, S.W.1, to whom applications should also be addressed.

County Council of Middlesex.

ASSISTANT MEDICAL OFFICER.

The County Council of Middlesex invite applications for the post of an Assistant Medical Officer in the Public Health and School Medical Department. The applicants must be duly qualified registered medical practitioners.

The duties of the post are the Medical Inspection of School Children, the supervision of treatment of minor ailments, the carrying out of work under the Maternity and Child Welfare Scheme, and such other duties as may be required by the Council. The officer appointed must devote whole time to the duties of the post, will act under the supervision and control of the County Medical Officer of Health, and will be required to reside in any place fixed by the Committee.

Salary at the rate of £600 per annum, rising after two years' service by yearly increments of £30 to £750 (no bonus). Reasonable travelling expenses allowed.

The successful candidate will be required to contribute to the County Council's Superannuation Fund and to pass such medical examination as the County Council may direct.

The appointment will be during the pleasure of the Council, and subject to one month's notice on either side.

Applications, stating (1) age, (2) qualifications, and (3) previous experience, together with copies of not more than three recent testimonials, must be sent to the undersigned not later than May 18th.

Canvassing, directly or indirectly, will be a disqualification.

ERNEST S. W. HART,
Clerk of the
County Council.

Magdalen Guildhall,
Westminster, S.W.1.
April 26th, 1929.

Boroughs of Neath and Port Talbot Education Committees.

Applications are invited from fully qualified and registered Dental Surgeons for the post of full-time DENTAL SURGEON to the Education Committees. The appointment is open to men and women. Salary £500 per annum. The duties will be: (1) the dental inspection and treatment of children under the Education Acts; (2) such other duties as may from time to time be imposed by the Education Committees.

The successful applicant will be required to reside within the area covered by the Joint Authorities, and to work under the direction of their Medical Officers. A knowledge of Welsh is desirable. Applications, stating age and experience, and accompanied by three recent testimonials, should be sent to the Town Clerk, Port Talbot, by June 1st.

MOSES THOMAS,
Town Clerk and Secretary to the
Education Committee,
Port Talbot.

ARTHUR J. EVANS,
Clerk to the Education Committee,
Neath.

City of Sheffield.

ASSISTANT TUBERCULOSIS OFFICER.

Wanted a male (unmarried) Assistant Tuberculosis Officer, to reside at WINTER STREET HOSPITAL, and to devote his whole time to the Municipal Tuberculosis Scheme.

Salary £450 per annum, rising to £500 per annum by annual increments of £25, with board, residence, and laundry.

Applicants must be registered medical practitioners, with not less than three years' experience.

Applications stating age, qualifications, and experience, with copies of testimonials, to be sent to the undersigned on or before May 16th.

Town Hall, FRED. E. WYNNE,
Sheffield. Medical Officer of Health.

Derby Union.

SECOND RESIDENT MEDICAL OFFICER.

Applications are invited for the appointment of Second Medical Officer (male) of the Guardians' Institution and Infirmary, which is a Major Training School for Nurses (a new Hospital of 350 beds is nearing completion). Salary at the rate of £250 per annum, with residential allowances.

Two months' notice of resignation to be given, to date from the Board meeting next after the receipt of the resignation.

The appointment will be subject to the sanction of the Ministry of Health and to the provisions of the Poor Law Officers Superannuation Act, 1896.

Applications with particulars of age, previous career, qualifications, diplomas, and certificates held, together with copies of three recent testimonials, must be sent in on or before Friday, May 17th.

Poor Law Offices, RALPH GRANTHAM,
Derby. Clerk to the Guardians.

County Borough of Southampton

ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited for the position of Assistant School Medical Officer at a salary of £600 per annum.

The gentleman appointed will hold office during the pleasure of the Council, and the appointment will be determinable by two months' notice on either side. He will be required to carry out duties in connection with the Medical Inspection and Treatment of School Children, the Public Health Acts, Mental Deficiency Acts, 1913-27, Maternity and Child Welfare and Venereal Disease work, etc.

He must devote the whole of his time to the duties of the office and the performance of such other duties as may be required under the direction of the Medical Officer of Health.

The appointment will be subject to the approval of the Board of Education and the Minister of Health.

The Local Government and Other Officers Superannuation Act, 1922, will be applicable to the appointment, and contributions to the Superannuation Fund will be deducted from the salary. The selected candidate will be required to pass a satisfactory medical examination.

Forms of application may be obtained from the Medical Officer of Health, Municipal Offices, Southampton.

Applications on the prescribed forms, endorsed "Assistant Medical Officer of Health," and stating age, qualifications, experience, etc., together with copies of not more than three recent testimonials, must be delivered at the Town Clerk's Office, Municipal Offices, Southampton, on or before May 18th.

R. RONALD H. MEGGESON,
Town Clerk.
April 29th, 1929.

County Borough of Southampton

APPOINTMENT OF SCHOOL DENTIST.

Applications are invited for the position of an Assistant School Dentist to carry out the dental examination, treatment, etc., of elementary school children.

The gentleman appointed must be fully qualified and registered. He will hold office during the pleasure of the Council and will be required to devote the whole of his time to the duties of the office and to act under the direction of the School Medical Officer.

Salary £450 per annum.

The Local Government and Other Officers Superannuation Act, 1922, will be applicable to the appointment, and contributions to the Superannuation Fund will be deducted from the salary. The selected candidate will be required to pass a satisfactory medical examination.

The appointment will be determinable by two months' notice on either side.

Forms of application may be obtained from the Medical Officer of Health, Municipal Offices, Southampton.

Application on the prescribed form, endorsed "School Dentist," together with copies of not more than three recent testimonials, must be delivered at the Town Clerk's Office on or before May 17th.

R. RONALD H. MEGGESON,
Town Clerk.
April 29th, 1929.

West Ham Union.

ASSISTANT MEDICAL OFFICERS.

The Guardians invite applications for the appointments of Two Resident Assistant Medical Officers (male) at their WHIPPS CROSS HOSPITAL, Whipps Cross Road, Leytonstone, E.11, at the salary in each case of £300 per annum, rising by annual increments of £25 to a maximum of £350 per annum, and the usual residential allowances.

Candidates must possess qualifications both in Medicine and Surgery, and preference will be given to those having previous Hospital experience. Intending applicants should communicate with or call on the Medical Superintendent who will furnish information as to the duties. The successful candidates will be required, should occasion arise, to act in any other Institution under the control of the Board.

Applications, stating age, experience, and qualifications, together with copies of not more than three testimonials, must reach the undersigned not later than 10 a.m. on Thursday, May 16th.

Union Offices, L. E. FRAQUET,

Winsley Sanatorium,
near BATH.

The Governors invite applications for the appointment of a whole-time ASSISTANT RESIDENT MEDICAL OFFICER (male). Salary £250, with apartments, board, laundry, etc.

The appointment will be made for a period of twelve months (subject, however, to termination during such period by one calendar month's notice on either side).

Forms of application and particulars of duties can be obtained from the undersigned, to whom all applications should be addressed, accompanied by not more than three recent testimonials, not later than first post May 11th.

T. A. W. CARLISLE,
Winsley Sanatorium, Secretary.
Near Bath. April 27th, 1929.

Gravesend and North Kent
HOSPITAL.

JUNIOR HOUSE SURGEON.

Applications are invited from fully qualified men for the above post.

The Hospital contains 72 beds and cots (extensions will bring this number up to 100 by July), and has a large Casualty, Out-patient, and Ophthalmic Department.

Owing to the unique situation of the Hospital at the Entrance to the Port of London, many accidents and interesting cases are treated, and the post affords an excellent opportunity for Surgical experience.

The appointment is now vacant, and will be for twelve months. Salary at following scale, with addition of board, lodging, and washing: £80 p.a. for first six months, £150 p.a. for second six months as Senior House Surgeon, payable *in equal monthly instalments*. There is also a possibility of the successful applicant being retained for a further six months as Resident Medical Officer at the rate of £200 p.a. Three weeks' holiday at end of first six months, and three weeks' holiday at end of second six months if appointed R.M.O., both on full pay.

The Hospital is fully equipped with modern X-ray and other apparatus.

Applications, with one copy of three recent testimonials, to be sent to the undersigned immediately.

C. E. CHAPMAN,
April 27th, 1929. Secretary.

Hackney Hospital.

The Guardians of the Hackney Union invite applications from duly qualified gentlemen for the position of JUNIOR ASSISTANT MEDICAL OFFICER.

Candidates must be single, and must have held a previous resident hospital appointment.

The Hospital, which is situate at High St., Homerton, E.9, contains 800 beds and is equipped with modern requirements.

Besides the Medical Superintendent, there are six Resident Medical Officers and a Clinical Pathologist.

The remuneration is at the rate of £330 per annum, rising £25 annually to a maximum of £375 per annum, together with rations, washing, furnished apartments, and attendance.

The officer appointed will be required to render assistance at the other establishments and departments of the Union, to assist in the training and instruction of nurses, and to devote the whole of his time to the service of the Guardians.

The appointment will be subject to the provisions of the Poor Law Officers Superannuation Act, 1896.

Further particulars as to the duties may be obtained from the Medical Superintendent

Canvassing the Guardians, directly or indirectly, will disqualify candidates.

Applications must be made upon forms which are obtainable from the undersigned. The forms must be completed and returned, with copies of not more than three recent testimonials, by Friday, May 10th.

By Order,
E. W. HARBOUR,
Clerk to the Guardians.

Clerk's Office, Hackney Union, 2, Sidney Rd., Homerton, E.9.

who have both had many years' experience as Medical Transfer Agents.

The commission chargeable in respect of any practice or partnership in Great Britain placed exclusively in the hands of this Agency has been fixed on an exceptionally favourable scale, the maximum chargeable on any transfer being fifty pounds (£50).

No charge is made to Principals for the introduction of Locum Tenens or Assistants.
Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges.

1. WITHIN 60 MILES OF LONDON.—Unopposed very old-established easily worked PRACTICE, in pretty country district about 5 miles from Hospital Town. Cash receipts last financial year £1,552 (shows considerable increase for last 9 months), including appts. and panel (nearly 1,200) £899. Visits 3/6 to 10/6, medicine extra. Practically no midwifery. Excellent modern freehold residence (bathroom, electric light, system drainage, etc.), with ample accommodation. Garden. Garage. Price £3,300, of which £2,300 can remain on mortgage. Premium £2,400, to include drugs, etc. Good hunting, shooting.
2. FAVOURITE INLAND SPA.—PARTNERSHIP.—A well qualified experienced gentleman (aged about 40, married, and good at Gynæcology) is required to purchase the half share of a good-class non-dispensing Practice owing to the retirement, through ill health, of one of the partners. Income £4,000 to £5,000, including appts. and small select panel. Suitable house available, possibly on rental. Premium 2 years' purchase.
3. SURREY.—WITHIN 15 MILES OF LONDON.—Old-established good middle-class PRACTICE, offering immense scope. Income last year about £1,150, with panel of 300, mostly selected servants. Fees, a few at 3/6, mainly 5/-. Visits chiefly 5/- and 10/6. Little midwifery. Very suitable flat or house available on rental. Prem. £1,500.
4. EASTERN COUNTY.—(Within easy reach of sea).—PARTNERSHIP, after six months' preliminary assistantship, at salary of £400 p.a., outdoor. A one-third share is offered in a good-class general Practice producing over £3,300 p.a. Panel of 1,300. Cottage Hospital and scope for surgery. Ingoing partner must be a gentleman and fond of country life. Premium 2 years' purchase.
5. MIDLANDS.—Country district, near large town.—Agricultural and working-class PRACTICE, rapidly increasing. Income last year £1,250, including panel of 545. Visits 3/6 and 5/-. Small convenient house, freehold. Price, including all furniture, excepting linen and plate, £1,650 (£1,000 on mortgage at 4 per cent.). Large garden. Garage. Excellent spot. Premium £1,800.
6. LANCS. COAST TOWN.—Old-established better and middle-class PRACTICE. Income for 1928 over £1,200. Panel of 556. Visits from 4/- Well situated house in residential district. Price for freehold £2,700, £1,500 on mortgage. Premium £1,800, £1,000 down and balance by instalments.
7. SOUTH AFRICA.—Well-established PRACTICE, in small pleasant Town (nearly 5,000 ft. above sea-level in midst of very prosperous and rich district). Receipts last financial year £2,198, including appts. worth £80. Opposition (one) weak. Bungalow residence containing 2 consulting rooms, surgery, 2 sitting, 2 bedrooms, bathroom, etc. Small garden. Garage. Price, freehold, £500; £200 can remain on mortgage. Premium £1,200, to include drugs, instruments, surgery and other furniture and effects in house. Climate excellent. Educational facilities and sport. Splendid opening for surgery.
8. NEW ZEALAND.—(North Island).—In an up-to-date Town (pop. 12,000, with a further 10,000 in outlying district) within 12 miles of the sea, a well-established PRACTICE worth last year over £1,000, including appts. averaging £280. Visits 10/6 to 21/-, mileage extra. No dispensing. Excellent Bungalow residence, in an acre of garden, with fruit trees, tennis court, etc., containing 9 rooms, bathroom, etc. Electric light, h. and c. water. Climate finest in New Zealand. Splendid educational facilities and unlimited sport. Scope for surgery.
9. PARTNERSHIP.—LONDON.—In a populous district, the half share of an old-established middle and working-class Practice, worth over £2,000 p.a., including panel of 1,300. Visits 3/6 to 10/6. Expenses light, car not necessary. House contains professional accommodation, 2 reception, 2 bedrooms, bathroom, etc. Held on lease at rental of about £60 p.a. Premium 2 years' purchase.
10. SOUTH COAST.—Popular and favourite Watering-place.—Old-established good-class mixed-class PRACTICE, worth last year nearly £1,000 including panel of over 1,150, and offering further scope. Visits 3/6 upwards. Mids from 4 gns. About 30 cases yearly. House contains eight rooms, with usual offices, and garden. Price £1,400 (at least £1,000 can be obtained on mortgage). Held by Vendor who will give efficient introduction, over 9 years.
11. PARTNERSHIP OUTLYING WESTERN SUBURB.—A one-third or one-half share is for disposal in a well-established mainly better working-class Practice producing over £2,500 p.a. Appointments worth about £150 p.a. and panel of 1,400. Fees from 2/6 to 21/-. Lowest midwifery 3 gns. Purchaser (if single) could reside in rooms, or suitable house obtained. Premium 2 years' purchase.
12. SHEFFIELD.—Good-class non-panel non-dispensing PRACTICE in best residential district. Average income for last three years over £3,000. Fees 5/- to 21/-. Midwifery 3 to 10 gns.; about 30 cases yearly. Surgery premises can be rented on lease, and contain consulting room, waiting room, 3 bedrooms. Electric light. Garden. Purchaser can live in best place of residence. Premium 1½ years' purchase, with 2 years' partnership introduction as required.
13. STAFFS. LARGE TOWN.—Owing to ill health of present Incumbent, an old-established good-class non-panel non-dispensing PRACTICE is for immediate disposal. Income last year over £1,200. Fees 5/- to 10/- Commodious house, in best residential road. Price for freehold £1,600, part on mortgage. Prem. £1,500, payable easy instalments.
14. SOUTH-WEST OF ENGLAND.—Large Thriving Hospital Town.—PARTNERSHIP.—The half or five-ninths share in an old-established better and middle-class non-panel general and surgical Practice can be acquired by a suitable gentleman possessing the F.R.C.S. degree. Receipts for the past three years average over £5,000 p.a. Good house, with ample accommodation, at present held on lease with option to purchase. Premium 2 years' purchase.
15. SOUTH-WESTERN COUNTY.—LARGE SEAPORT TOWN.—Old established mixed-class PRACTICE averaging over £3,000 p.a., including panel of 2,100. Visits 3/6 to 10/6; midwifery (discouraged of late) 3 gns. upwards, about 30 cases yearly. Expenses light (Assistant not necessary). House contains professional accommodation, 3 sitting, 6 bedrooms, bathroom, etc. Large garden, garage. Vendor's freehold price £2,800, of which £1,200 can remain on mortgage, or might be rented at £96 p.a. Premium 1½ years' purchase, £3,000 down and balance by arrangement.
16. BORDERS OF NORFOLK AND SUFFOLK. — Very old-estab. good middle-class PRACTICE, averaging over £1,000 p.a., including panel of 530. Visits from 3/6. Easily worked. Very attractive house, modernized, and containing 3 reception, 6 bedrooms, bathroom (h. and c.), separate professional accommodation. Price for freehold £2,000. Premium £1,500.
17. NORTH DEVON.—Within easy reach of favourite town.—PARTNERSHIP.—A one-third share (to commence) in a well-established and increasing Practice, producing about £3,000 p.a., including panel of over 2,000. Fees 3/6 to 10/6. Choice of houses. Excellent sport, good schools. Premium 2 years' purchase, half down and balance by instalments.
18. LONDON, S.W.—PARTNERSHIP.—A one-fourth or one-third share in an old-established good middle and better working-class Practice, producing £2,500 p.a. Preliminary assistantship offered. Scotch Graduate, 25 to 35, preferred.
19. LONDON, S.W.—Pleasant Suburb.—Old-established PRACTICE, producing over £500 p.a., including panel of 417. Visits 3/6 to 5/-. Little midwifery. Eight-roomed house, with fair-sized garden. Rent £60. Premium £700.
20. LONDON, S.W.—Established Panel PRACTICE, producing £700 p.a. Good scope. Surgery premises can be obtained on rental. Premium £1,000.
21. HOME COUNTY.—Within 40 miles of London.—In small Village (with large surrounding population) in pleasant district, old established mixed and increasing PRACTICE, worth last year nearly £3,600, including Union and Vaccination over £100, and panel producing over £1,150. Railway station in place. House contains surgery and waiting rooms (separate entrance), 2 reception, 4 bedrooms, bathroom, etc., large garden. Gas, electric light available. Price for freehold £2,500, part mortgage. Premium 1½ years' purchase. Good society, sport, etc. Vendor keeps an Assistant, but investment would admirably admit of taking a partner later on, as houses available.
22. ESSEX. — Small Country Town. — Well-established and increasing PRACTICE, producing about £800 for last 12 months, including panel of 525 and appointments worth about £60. Advice and medicine chiefly 3/6 to 7/6; visits 3/6 to 21/-, medicine extra. Midwifery (discouraged) 2 to 5 gns. Exceptionally nice house, with lounge hall, 3 reception, 5 bedrooms, good professional rooms, and usual offices. Hot water supply. Electric light. Large garden, with tennis court. Garage for 2 cars. All in perfect order. Price for freehold £5,100. Premium 1½ years' purchase.
23. WITHIN ONE HOUR OF LONDON (good train service).—Old-established mixed-class PRACTICE, offering good scope. Average income about £600. Fees 2/6 to 7/6. Not much midwifery. Easily worked. Semi-detached house in good condition, with 2 reception, 5 bedrooms, etc. Surgery and waiting room. Garden. Rent on lease £65 p.a. Premium 1½ years' purchase, or near offer.
24. SOUTH-WEST OF ENGLAND.—PARTNERSHIP.—A one-half share in a very old-established Practice situated in an attractive small town, amidst beautiful surroundings, and within easy reach of the coast. Gross cash receipts for the past year over £2,900. Panel of 1,916 which, together with appts., brings in about £900 p.a. Moderate expenses. Visits 2/6, plus mileage and medicine 2/6 and 3/6 extra. Very suitable house, with 3 reception, 4 bedrooms, and usual offices. Garden. Price for freehold £750, of which £350 on mortgage. Premium 2 years' purchase.
25. LANCS. — LARGE TOWN, within easy reach of Manchester and Liverpool.—Old-established PRACTICE. Average income for past 12 months £1,500, including panel of nearly 1,500. Fees 2/6 to 10/6. Good house, with nice garden. Can be rented on lease at £65 p.a. Premium only 1½ years' purchase for prompt sale.
26. NEAR SOUTH COAST.—Old-established mixed-class PRACTICE, situated in delightful country district within easy reach of two favourite towns. Income last year over £1,600. Panel of about 700. Fees 3/6 to 21/-. Midwifery 2 to 7 gns; very few cases. Good house, standing in its own grounds, with 2 reception, 5 bedrooms, etc. Garage for two cars. Sport of all kinds, and good schools within reach. Premium £2,250.

Full Schedule of Terms and Conditions will be forwarded on application.

Printed and published by the British Medical Association, at their Office, Tavistock Square, in the Parish of St. Pancras, in the County of London.

$C_8 H_{10} N_4 O_2 + H_2 O$

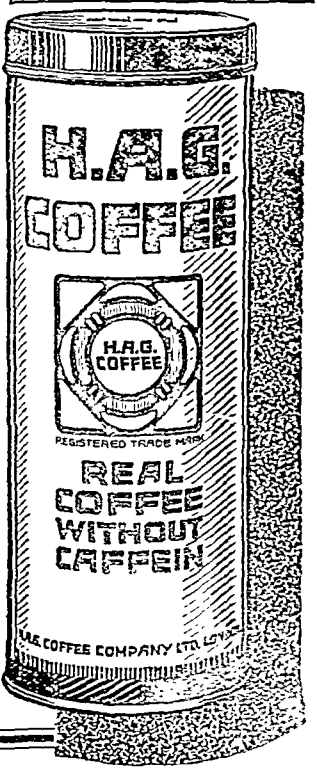
THE injurious action of caffein, to which the ailing, reconvalescents and those in good health become liable by the habitual or excessive consumption of coffee and tea, is causing an increased interest in the medical world. There is already a comprehensive literature dealing with this subject; in many cases it absolutely bans the consumption of beverages containing caffein.

THE physician who is solicitous with regard to the welfare and ailments of his patients will specially value the knowledge that **H.A.G. COFFEE**—a caffein-free berry coffee—is obtainable, which in respect to aroma and palatableness, affords the same sense of enjoyment as ordinary coffee containing caffein, but without its harmful action on the cardiac, the nervous, and the vascular system.

WITH **H.A.G. COFFEE** the caffein is extracted from the unroasted coffee bean by a patented process, until only a slight, non-effective trace remains. Previous to this treatment, the coffee beans undergo a most thorough cleansing.

CAFFEIN-free **H. A. G. COFFEE** can confidently be recommended as the best and most valuable health coffee, and, in order to give members of the Medical Profession an opportunity of personally appreciating the hygienic characteristics of **H.A.G. COFFEE,** we shall be pleased to send a sample and literature free on request.

H.A.G. Coffee can be obtained in 2 sizes, price 3/2 and 1/8, either ground or in the bean. If your grocer has no stock we will supply post free upon receipt of your remittance

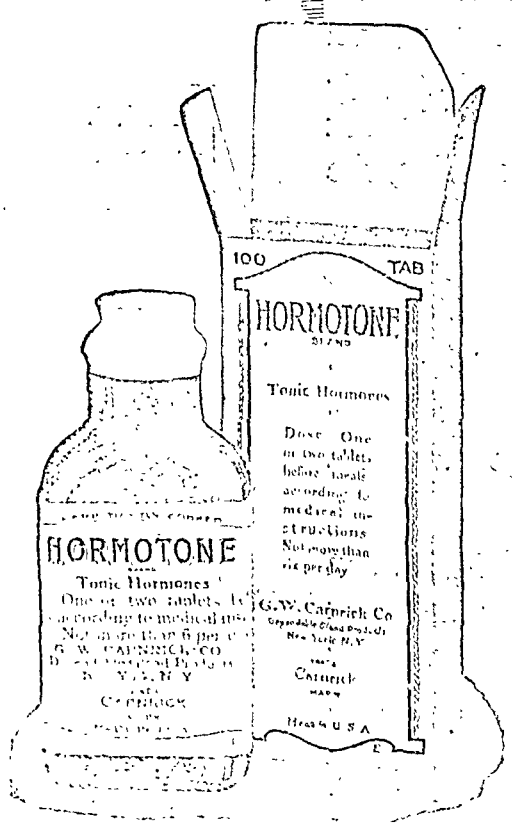


H.A.G. COFFEE CO. LTD.

40 Theobald's Road, London, W.C.1

ASTHENIA and the Fatigue Syndrome

are usually conditions in which a definite pathology cannot be demonstrated.



Hormotone
BRAND

has proved its value in treatment, through its action in:

Stimulating cell metabolism,

Increasing the respiratory exchange,

and

Raising to normal the low blood pressure usually attendant upon such conditions.

Dose: One or two tablets three times daily before meals.

'CHARKAOLIN'
GRANULES

A Combination of Highly Activated Charcoal with 'Osmo' Kaolin

'Charkaolin' is a new and highly efficient agent for the treatment of intestinal infections characterized by abnormal fermentation and the formation of toxins. It combines the absorbent properties of highly activated vegetable charcoal with the well-known toxin adsorbing qualities of 'Osmo' Kaolin. It is in the form of fine, clean granules which disintegrate rapidly in water and diffuse their ingredients evenly throughout the liquid. 'Charkaolin' is tasteless, forms a fine suspension in water and is, therefore, quite easy to take.

Descriptive literature and a clinical trial sample will be sent on application.

The Therapeutic value of BRANDY—

its lifting and sustaining powers—as compared with other spirits depends on the presence or absence of the higher Alcohols or Ethers. These in turn depend on Grape, Soil, Stills employed, Climate, Storage, Selection and Experience.

It is quite easy to make a spirit from grape wine—It is neither easy nor cheap to make a Brandy containing the qualities you want.

Cognac Brandy alone provides them.

Take no risks;
ensure the results you expect

Prescribe Brandy distilled in Pot Stills from Wines grown in the best Cognac districts; Matured in warehouses which have been filled with Cognac Brandy for centuries; Made by Men with the inherited Experience of Seven Generations.

In short—Prescribe
MARTELL'S BRANDY
and know *that you are doing the best possible for your patients.*

MEDICAL BOOKS

SERIES OF—

MODERN MEDICAL MONOGRAPHS

Edited by HUGH MACLEAN, M.D., D.Sc., F.R.C.P.

Designed specially to meet the requirements of the general practitioner by providing him with concise and up-to-date accounts of the position of various subjects of general medical interest.

THE ENDOCRINES IN GENERAL MEDICINE

W. LANGDON BROWN, M.A., M.D., F.R.C.P. (Physician to St. Bartholomew's Hospital). 7s. 6d. net.

"The combination of early physiological work, clinical experience, and wide reading has enabled Dr. W. Langdon Brown to write a clear and philosophical handbook full of suggestive ideas on this difficult subject. Attractive from its potentialities and therefore open to rash speculation in the armchair, the therapeutic use of endocrine preparations is much in need of such an authoritative and well-considered opinion."—*Extract* BRITISH MEDICAL JOURNAL.

MODERN VIEWS ON DIGESTION AND GASTRIC DISEASE

HUGH MACLEAN, M.D., D.Sc., F.R.C.P. (Prof. of Medicine, London University). Second Ed. 12s. net.

The present day position of gas[illegible]athology is here presented in a most lucid and able manner. Professor Maclean emphasises the fact th[illegible] of gastric diseases must be based on physiological knowledge. In this monograph he also gives full [illegible]atment of duodenal ulcers, and proves that recourse to surgical measures is not generally necessary in order to bring about successful results.

HEART DISEASE IN CHILDHOOD

H. B. RUSSELL, M.D., M.R.C.P., and C. K. J. HAMILTON, B.M., M.R.C.P. 7s. 6d. net.

This subject opens up a very extensive field, and in order to keep this volume within reasonable bounds the authors have limited themselves to a discussion of the essentials only of the disease. A chapter has been devoted to the consideration of rheumatism, and the symptoms of, and treatment for, acute rheumatic pericarditis, endocarditis, myocarditis, and congenital heart disease are dealt with in a way such as will commend itself to the practitioner. A chapter on the electrocardiograph and its application and uses is included.

OTHER VOLUMES IN THE SERIES

FEEDING IN INFANCY AND CHILDHOOD.

"MEDISUN"

ULTRA-VIOLET LIGHT APPARATUS

100% BRITISH.

Specification:

The "MEDISUN" Ultra-Violet Light Apparatus is of the quartz mercury vapour type. It has been so designed as to eliminate all unnecessary expense, and yet provide an efficient source of ultra-violet radiation, quick in its reaction speed, not requiring adjustment, and foolproof in its mechanical details. Whilst the price of the "Medisun" is quite low, its appearance is really first class. Manufactured in polished aluminium throughout, it does not require frequent cleaning, is designed to stand on any table, weighs only 14 lb., and is a thoroughly reliable piece of apparatus.

RUNNING COST: **30 TREATMENTS 3d.**

Price:

For use on Direct Current ... £12
For use on Alternating Current £18

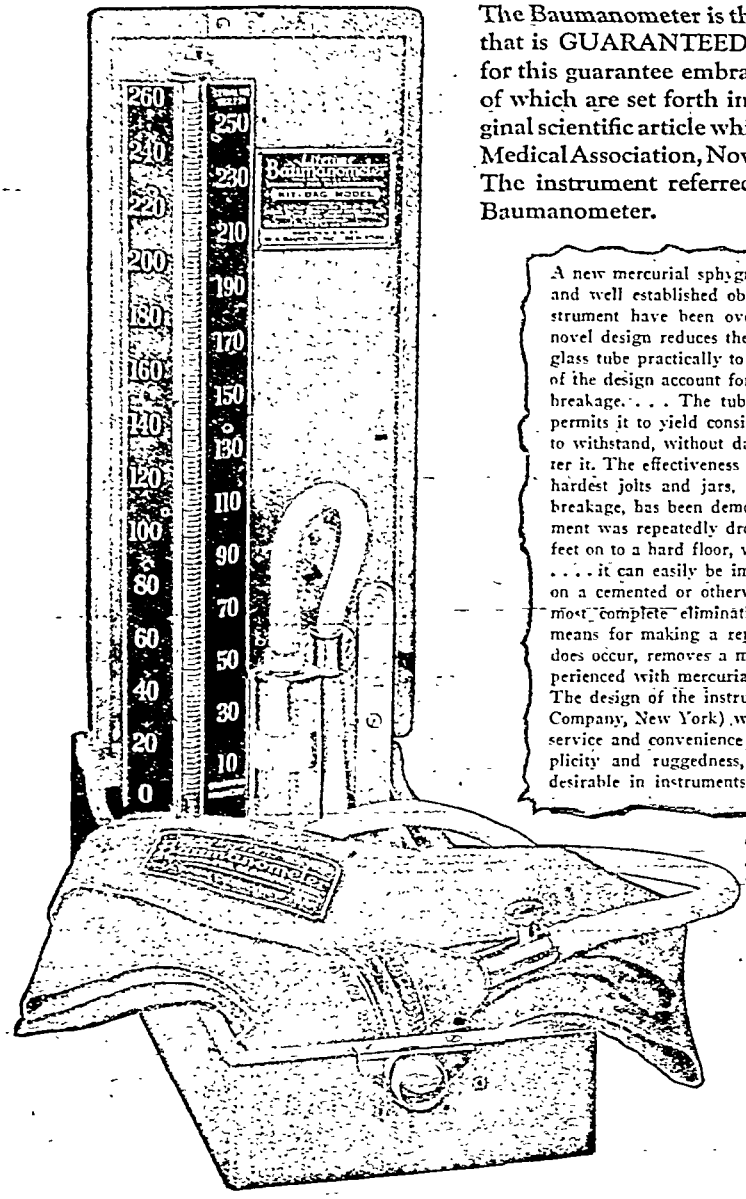
The *Lifetime* GUARANTEE
—*its TRUE significance*



The Baumanometer is the only instrument in all of the world that is GUARANTEED against glass breakage. The *reason* for this guarantee embraces certain facts, the more important of which are set forth in the following excerpts from an original scientific article which appeared in the Journal American Medical Association, Nov. 20, 1926, Vol. 87, pp. 1742 and 1743. The instrument referred to, of course, is the new Lifetime Baumanometer.

A new mercurial sphygmomanometer in which several important and well established objections to this type of bloodpressure instrument have been overcome has been developed recently. Its novel design reduces the possibility of accidental breakage of the glass tube practically to the vanishing point . . . Several features of the design account for the almost complete elimination of glass breakage. . . . The tube is held in a resilient mounting which permits it to yield considerably to side and end thrusts and thus to withstand, without damage, shocks that would otherwise shatter it. The effectiveness of this unique mounting in absorbing the hardest jolts and jars, and thus protecting the glass tube from breakage, has been demonstrated. A completely assembled instrument was repeatedly dropped in all positions from a height of 4 feet on to a hard floor, without injury to the tube in any instance. . . . . it can easily be imagined what would have been the effect on a cemented or otherwise rigidly mounted tube. . . . . The almost complete elimination of glass breakage, and the simple means for making a repair in the rare case in which breakage does occur, removes a most exasperating difficulty heretofore experienced with mercurial sphygmomanometers. . . .
The design of the instrument shown (made by the W. A. Baum Company, New York) was developed along the lines of maximum service and convenience to the user, without the sacrifice of simplicity and ruggedness, which experience has shown to be so desirable in instruments of this character.

That is why the Baumanometer is guaranteed against glass breakage; and why no other instrument is so guaranteed at all—much less for the user's *lifetime!*

That is why we can assure you of perfect, uninterrupted bloodpressure service for your lifetime... *You couldn't expect more, —don't be satisfied with less.*

Lifetime Baumanometer
STANDARD FOR BLOODPRESSURE

Obtainable from all dealers or from the British Distributors:

HAWKSLEY & SONS, Ltd., 83 Wigmore St., London, W. 1

This preparation is now obtainable in 5-oz. bottles.

MIST. DAMIANÆ CO. (HEWLETT'S).

MIST. DAMIANÆ CO. (Hewlett's) will be found to possess all the properties of Damiana, viz.:—Its alterative effects on the alimentary canal and tonic action upon the brain and nervous system generally.

In all the various forms of loss of nerve power Mist. Damianæ Co. (Hewlett's) is a powerful remedy, relieving the exhaustion and conferring renewed capacity for mental and physical endurance.

As a nerve tonic and brain stimulant it is unequalled, and its invigorating properties will be found invaluable in many diseases where there is great depression and exhaustion. In paraplegia, hemiplegia, and partial paralysis it is particularly indicated, and may be suitably and satisfactorily employed wherever a powerful nerve stimulant and restorative are required. Dose: One or Two Drachms in Water.

Packed in 5-oz., 10-oz., 22-oz., 40-oz., and 90-oz. Bottles. Price in England 12/6 per pound.

Introduced and Prepared only by— C. J. HEWLETT & SON, Ltd., 35 to 42, Charlotte St., LONDON, E.C.2.

Sole Agents for the

HUMAN TUBERCLE BACILLUS SOLUTION (H.T.S.) (CROFTON)

THE MOST POWERFUL TUBERCLE BACILLUS ANTIGEN YET PRODUCED.

Prescribed in numerous cases of *nervous and heart disorders, also rheumatic conditions,* etc.

The active substances of the extracts from cone bearing pine trees (Pinus silvestris, Abies alba, Pinus montana) is found in an oily substance commonly known as pine oil.

Novopine Sparkling Pine Bath Tablets contain this oil in a convenient form and an effervescence is introduced to facilitate successful solution in the bath. Their therapeutic value lies in their action on skin, lungs, and heart. For, in addition to the direct action through the pores of the skin, the ozonic aroma given off is automatically inhaled during the taking of a hot bath.

Besides their general cleansing and health-giving properties, they have been found especially beneficial as a remedy against nervous heart diseases and kindred disorders.

Samples on request from Natural Products Ltd., 40, Furnival Street, E.C.4.

What your Professional Colleagues say of HUMANISED TRUFOOD

Dear Sir,

It has always been a rule of mine to avoid writing anything in the nature of a testimonial. So excellent, however, has been the result of your Humanised Trufood in the case of my own seven months' old baby that I feel a line at least of congratulation is due to you.

This personal test, referred to here, has convinced me that this preparation of yours is an ideal medium for the purpose of supplementing breast milk in cases where the latter is insufficient in quantity. At three months of age my own child was 2½ lbs. under the average weight. By means of careful test weighing, and an addition of Humanised Trufood to make up the requisite quantity following each breast feed, the baby's weight steadily rose, and reached normal in less than five weeks.

She is now doing splendidly (seven months) and is second to none in health, looks, and liveliness.

(Signed) ———, *M.R.C.S., L.R.C.P.*

TRUFOOD LIMITED, THE CREAMERIES, WRENBURY, NR. NANTWICH, CHESHIRE

WHY HOVIS MATTERS

Largest VITAMIN B Content

Important Conclusions

The question as to what form of bread provides the essential Vitamin B most completely and economically has now been settled by independent experiments.

It is shown that in 100 g. dried bread the content of Vitamin B in milling products and yeast is:

White Bread	200
Wholemeal Bread	1,450
HOVIS Germ Bread	2,600

That the presence of the Vitamin is essential actively to promote health in adults and sturdy growth in children, is generally accepted from continued observation.

Wheat is rich in Vitamin B and the germ is the richest part.

HOVIS is made from the white flour, with the germ added. This gives HOVIS its pre-eminent position as a basic ration.

You obtain—as demonstrated by series of experiments by independent investigators—a greater active nutritive value from HOVIS than from any other cereal.

You need a smaller amount of HOVIS than any other bread for the proportion of nourishment received. This is a matter of very practical importance, especially where, as in so many homes and institutions, bread of necessity forms a large part of the daily diet. With children especially, a far larger amount of Vitamin B is supplied to them when fed on HOVIS.

One slice of HOVIS weighing 1 oz. contains as much Vitamin as 2 oz. of Wholemeal, and as 5 to 6 g. of fresh yeast.

Everybody likes it—another practical consideration, especially with children, and it is digested nearly as easily as white bread, and much more so than wholemeal.

HOVIS

(Trade Mark.)

Best Bakers Bake It

HOVIS LTD. LONDON & MACCLESFIELD

Invaluable as a Galactagogue

This nourishing and sustaining food drink is helpful to nursing or expectant mothers

NOT only hundreds, but literally thousands of cases are recorded in which this well-known preparation — Horlick's Malted Milk — has proved its efficiency as a body-building food.

It is particularly valuable as an addition to the diet of the expectant and nursing mother. For Horlick's is a perfectly balanced food containing fat, proteins and soluble carbohydrates combined together in correct nutritive ratio. It is prepared from fresh, full-cream cows' milk, selected wheat and malted barley — and, during manufacture, is partially predigested to ensure easy assimilation.

Horlick's is rich in valuable malt-sugars, but contains neither cane sugar nor free starch. It is therefore extremely easily digested, and highly productive of energy.

These characteristics make it valuable as a galactagogue. Its abundant nutriment supplements any deficiencies in the mother's regular diet, and promotes a regular and nourishing supply of milk, and its easy digestibility makes it acceptable when other forms of nourishment are unwelcome.

Taken during pregnancy, it builds up the mother and helps to maintain her vitality. A cupful taken regularly first thing in the morning frequently abolishes and almost invariably alleviates the discomfort of morning sickness.

Horlick's is now obtainable in two forms — the original, natural-flavoured Malted Milk, and the new Chocolate Flavoured form — identical in its constituents with the original Horlick's, but flavoured with fine chocolate. Horlick's is sold in sealed glass bottles, price 2/-, 3/6, 8/6, 15/-. Also in tablet form.

Further details may be obtained from Horlick's Malted Milk Co., Ltd., Slough, Bucks.

Therapeutic Ointments

CAPROKOL

(Hexyl-resorcinol B.D.H.)

The advent of a new journal devoted entirely to the subject of the treatment of urinary diseases serves to emphasise the importance of the study of urology.

Caprokol, immediately after its discovery, established itself as the best all-round antiseptic for use in the treatment of urinary tract infections.

Caprokol therapy gives immediate relief from the pain, frequency and other distressing symptoms associated with urinary troubles. The administration of Caprokol ensures hours of continuous sleep (unbroken by the necessity for frequent micturition), resulting in comfort, increase of appetite and marked improvement in general health.

Clinical evidence shows also that persistent treatment with Caprokol leads, on account of its continuous germicidal action on the urine, to complete disinfection of the urinary tract.

Manganese Butyrate B.D.H.

Manganese Butyrate B.D.H. is proving itself to be of exceptional value in the treatment of acute infections, particularly those of staphylococcic and streptococcic origin.

In cases of furunculosis, carbuncles, erysipelas and whitlows Manganese Butyrate therapy is particularly successful, whilst some very striking results have been obtained with it in acute gonococcal urethritis.

Literature on request

Manganese Butyrate B.D.H. is supplied in ampoules and in rubber-capped vaccine bottles containing a 1 per cent. aqueous solution ready for intramuscular injection.

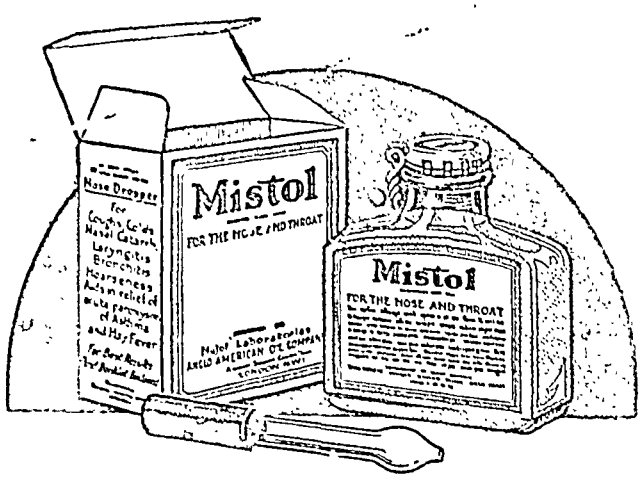
For Head Colds Prescribe "Mistol"



MISTOL and the Mistol Dropper are a real advance in nose and throat therapy. Menthol, eucalyptol, camphor, and chlorbutynol are combined in a specially prepared petroleum base, which keeps these soothing and healing ingredients in direct contact with the mucous membrane for a considerable length of time.

Unlike douches, Mistol avoids any possibility of sinus trouble. With head tilted back, the patient should let Mistol drop into each nostril until it is felt to be running into the back of the throat. It is manifestly superior to salves which do not reach all parts of the mucous membrane.

Especially efficacious in coughs and colds, simple, congestive, and catarrhal rhinitis, hoarseness, bronchitis, and laryngitis.

Sold in original sealed cartons containing a—

Mistol
(Registered Trade Mark)

Two-ounce Bottle and Mistol Dropper.

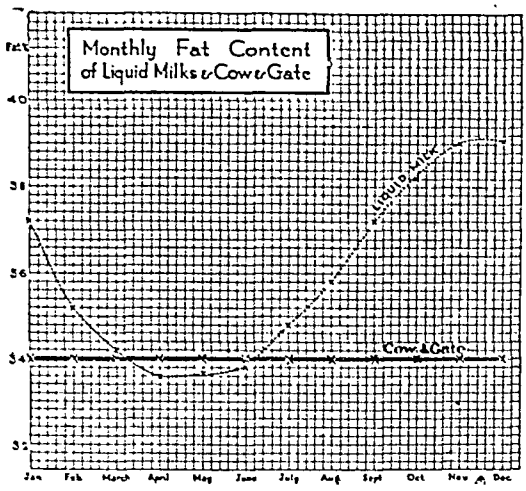
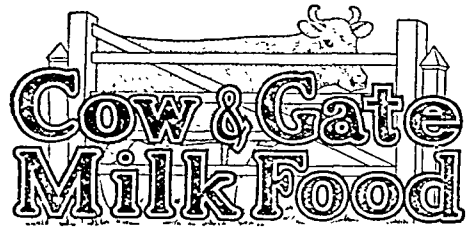
A RELIABLE BASIS



The above chart shows the large fluctuations in the fat content of liquid milks throughout the year, as compared with the unvarying fat content of COW & GATE, which is based on the fat content of average healthy Breast Milk.

Fat content in COW & GATE reconstituted (1 in 8) 3.4%
Fat content in average Breast Milk 3.3% — 3.5%

This is ONE of the many reasons why COW & GATE is one of the safest and most reliable alternatives when breast-feeding fails, and why it affords the most reliable basis for Infant-feeding modifications.



ENQUIRIES FOR FURTHER INFORMATION ARE INVITED.

NEW-PROMONTA

A SPECIFIC FOOD FOR NERVES AND BRAIN

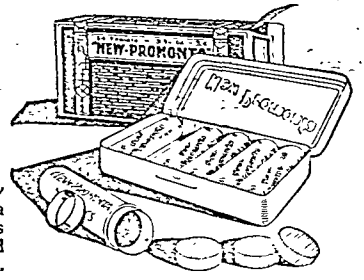
It has been definitely established both in private practice and clinical work that "NEW-PROMONTA" is a very valuable aid in stimulating healthy cell formation and growth, particularly as regards the nerves and brain.

The value of "NEW-PROMONTA" is due to the very high percentage of Nerve Lipoids present in it, and in no less degree to the fact that a special method of preparation leaves Lipoids, Phosphatides, and Cholesterols not only intact, but also in the exact combination in which they are present in the living nerve cells.

In addition to the constituents mentioned above, "NEW-PROMONTA" contains other, well-known body builders and nutritious substances—notably Iron, Hæmoglobin, Lime, Albumins, and the Vitamins A, B, D, and E.

TO TEST "NEW-PROMONTA."

A trial supply of "NEW-PROMONTA," together with a collection of authoritative data on its composition and the tests to which it has already been subjected, will be sent post free to any Doctor, Clinic, or Hospital upon application.



"NEW-PROMONTA" in tablet form is supplied in handy boxes containing 54 tablets at 3/6. Each box includes a metal container for the pocket, which holds a day's supply. "NEW-PROMONTA" in powder form is supplied in sealed air-tight boxes of ¼-lb. at 3/-, and ½-lb. at 5/6.

PROMONTA COMPANY LIMITED, Westmorland House, 127/131, Regent Street, LONDON, W.1.

Successful Treatment of Hyperchlorhydria and Associated Conditions

"Alocol" (Colloidal Hydroxide of Aluminium) has proved remarkably successful in the treatment of hyperchlorhydria, gastric ulcer, fermentative dyspepsias with gastro-intestinal flatulence, acid eructation and other symptoms common to gastric disease.

The advantages of "Alocol" are that it actually removes from the system the causative acid radicle (Cl) instead of merely neutralising it, and so permitting reabsorption, accumulation and consequent recurrence of the symptoms of the disease.

Furthermore, "Alocol" neither hinders proteolysis nor causes destruction of any food element or factor. "Alocol" has a distinct healing and sedative effect; it promptly allays irritation by absorbing acid and other irritants.

Complete chemical history of "Alocol" with convincing clinical reports and supply for trial, sent free to physicians on request.

Intestinal Disinfection

ALIMENTARY TOXÆMIAS

IN our last advertisement, the subject of Alimentary Toxæmia was briefly discussed, and intestinal disinfection by means of Kerol Capsules was held to be the first line of treatment.

The reason for this may be stated as follows:—None of the ordinary so-called intestinal antiseptics, such as Salol and Beta Naphthol, are found experimentally to exert any disinfection of the contents of the bowel.

On the other hand, the high boiling hydroxyl compounds of the coal tar series are potent germicides, and, being unabsorbed, are non-toxic. They can therefore be administered freely without harm, and are found to prevent the multiplication of the toxæmic intestinal bacteria and to reduce them considerably.

The active principle of Kerol is a complex mixture of these compounds. The administration of two 3-minim capsules thrice daily after meals has been repeatedly shown to reduce the coli content of the stools of individuals taking them by 99 per cent.

For intestinal disinfection, use KEROL CAPSULES (keratin-coated); they contain 3 minims of Kerol. One to three capsules may be given three or four times a day after meals.

Please send for Literature and Samples, which will be sent free to any member of the Medical Profession.

The Commencement of Treatment

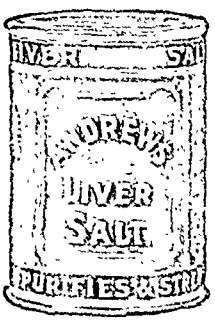
The pathological changes observed in the various organs in most diseases are due to the absorption of poisons, either locally or from the intestine.

After treating the cause, the next step is essentially elimination of the toxin by the bowels, kidneys and skin.

This is especially important in the infectious and acute febrile diseases.

It is sometimes overlooked in chronic diseases such as rheumatism, exophthalmic goitre, iritis, etc.

A safe and efficient aperient is found in Andrews Liver Salt. Palatable to young and old alike, antacid in action, it is especially useful in febrile conditions, where its effervescing properties relieve thirst and cool the dry parched mouth.



Dose: ½-3 *teaspoonfuls in a glass of water.*

N.B. *A large size tin will be sent free on request to any member of the medical profession.*

Andrews Liver Salt

SCOTT & TURNER LIMITED, Works and Laboratories at Newcastle-on-Tyne.

THE ENTIRE GROUP OF NITROGENOUS SUBSTANCES OF LEAN BEEF AND ENTIRE WHEAT GRAIN,

THOSE NATIVELY SOLUBLE AND THOSE RENDERED SOLUBLE BY PHYSIOLOGICAL HYDROLYSIS, AMINO-ACIDS AND POLYPEPTIDS WITH THE NATURAL SAVORY EXTRACTIVES AND MINERALS. THE WHEAT CARBOHYDRATES PHYSIOLOGICALLY CONVERTED TO DEXTRIN AND MALTOSE.

All this Blended in a Calculated Ratio, One of Nitrogenous to Two and One-Half of Carbohydrate, in a Highly Agreeable Fluid.

THIS IS 'PANOPEPTON'—A DYNAMIC FOOD

In the preparation of Panopepton the beef is submitted to the action of gastric juice extract at normal temperature and acidity to a complete conversion of the proteins; the clarified solution concentrated in vacuo.

The hard wheat grain, well-cooked like a cereal, is subjected to both proteolytic and amylolytic digestion by a freshly prepared pancreas gland extract at normal media and temperature, until free from coagulable protein, and free from starch, the clarified solution concentrated in vacuo. The soluble concentrates of the beef and wheat are combined on the basis of assay.

Thus in Panopepton is assembled this designed comprehensive variety of protein derivatives, highly diffusible, physiologically complementary, mutually helpful in nutrition; of the native wheat-berry—albumen (vegetable), glutin-casein, glutin-fibrin, gliadin, mucedin; of beef—albumen, myosin, connective tissue-protein (source of gelatin), beef extractives, creatin, creatinin, sarcin, xanthin, and inosin. With the natively soluble associated principles, mineral, etc., as well as these principles of the gastric and pancreatic gland concentrates employed in the hydrolysis of the basic food.

Panopepton is a bright, rather dense, deep amber colored fluid, with a characteristic bouquet, grateful to the palate and stomachic. The finished product contains 24% of total dry solids.

Protein	6.50	
Carbohydrates	16.50	
Ash	1.	— 24.00

Panopepton is of a uniform standardized composition; it is highly agreeable; requires no preparation. It is a potent restorative and emergency food in serious straits; a fortunate recourse for the invalid.

Panopepton is a dynamic food.

Panopepton is most acceptable taken cold, undiluted.

Vita-Weat—the perfect "staff of life"

Analysis and tests of Vita-Weat, the British whole-wheat crispbread, show that it possesses in a marked degree the six essential constituents—carbohydrates, fat, proteins, mineral salts, water, *and the essential vitamins.*

100% Whole Wheat.

Being made from the whole wheat berry, from which nothing has been removed in manufacture, Vita-Weat yields the highest natural percentage of cereal proteins, and by the process of manufacture the starch present is rendered easily available for the solvent action of the amylolytic ferments of the human digestive juices.

Further, Vita-Weat is specially valuable as a natural stimulant to peristaltic action of the intestines, and when forming a suitable proportion of the daily diet effectively counteracts constipation.

Vitamins A, D, and B.

The dry condition of Vita-Weat is of distinct advantage in cases of flatulence in which moist foods are largely contra-indicated, and the crisp character of the sections also helps to reduce the intake of soft foods, giving the teeth and masticating muscles something to do and ensuring complete and thorough salivation of the food bolus.

Vita-Weat crispbread presents the whole wheat berry in a concentrated, attractive and digestible form with the Vitamins A, D & B in an active condition, and it forms a valuable addition to rational diet, presenting a dainty and advantageous alternative to soft wholemeal or white bread.

GENATOSAN LTD

(Makers of Sanatogen, Genasprin and Formamint and suppliers of Bacteriological and therapeutic preparations to the Medical Profession)

announce

FIVE NEW DENTAL PREPARATIONS

The appreciation by the medical profession of their existing preparations encourages Genatosan, Ltd., to hope that the dental preparations now introduced will meet with similar endorsement by the dental profession.

Though described as new products, they are in no sense untried. They are the results of long and careful research by a well-known dental surgeon who tested them in his own practice and had the advantage of the co-operation of a distinguished bacteriologist. The five preparations are :

GENOVAX a local detoxicated vaccine for the prophylaxis and cure of pyorrhœa and allied suppurative conditions.

GENOZO Brand TOOTH-PASTE which contains the necessary proportion of Genovax to immunise against pyorrhœa. Genozo is non-acid and non-alkaline.

GENOCAIN local anæsthetic containing not more than 1 per cent. of cocaine of the highest purity, nor a greater strength of suprarenin than 1 in 200,000.

GENO-SED socket-sedative for use after extractions to relieve pain.

GENOZO Brand MOUTH-WASH TABLETS. Effervescent tablets which produce an effective and pleasant mouth wash for chair-side use.

A copy of the Genatosan Dental Bulletin giving full particulars of these preparations is being sent to all dental practitioners in May, but those who do not receive a copy owing to change of address or other reasons are invited to apply for a copy to the Dental Products Department of

GENATOSAN LTD., LOUGHBOROUGH, LEICESTERSHIRE

What Kind of Barley?

The virtues of Barley both in the feeding of infants and for medicinal purposes generally are widely recognised. That Robinson's "Patent" Barley is relatively cheaper than pearl barley is, however, unknown to many people.

		Wastage	*Cost of 1 pint of Barley Water*
Robinson's "Patent" Barley		*Nil*	0.19*d.*
Pearl Barley	*Loose*	87.5%	0.25*d.*
Pearl Barley	*Packed*	87.5%	0.40*d.*

The above figures are true in spite of the fact that Robinson's "Patent" Barley costs 1/3d. per lb., whilst Pearl Barley costs 2½d. to 4d. per lb. The apparent anomaly is due to the fact that when Pearl Barley is used to prepare Barley Water at least seven-eighths of the quantity taken is wasted, whereas, in the case of "Patent" Barley practically the whole of the Barley Flour is incorporated as Barley Water.

* * *

APART from the question of cheapness there are two other reasons why Robinson's "Patent" Barley is preferable in use to Pearl Barley:—

1. The conditions under which Robinson's "Patent" Barley is cleaned and ground are such that the final product satisfies the most exacting tests of purity.

This cannot be said in all cases of Pearl Barley, which is sold to a large extent in the loose form.

2. The process of preparation of Barley Water from Robinson's "Patent" Barley takes 5-10 minutes at the most, whereas, in the preparation of Barley Water of a satisfactory strength from Pearl Barley the time taken is anything from 1½ to 3 hours. This difference in case of preparation is due to the finely ground condition of Robinson's "Patent" Barley.

Aesculapius

Hay Fever & Asthma

For the relief of hay fever, asthma and allergic diseases, Ephedrine Hydrochloride is proving most useful. To obtain proper clinical results it is necessary that the salt be in a state of absolute purity, including freedom from pseudo-ephedrine. This may be ensured by prescribing products of our manufacture, as follows:—

Ephresol

An effective Nasal Spray incorporating with ephedrine useful medicaments, which accentuate the beneficial effects of the drug. It is most valuable in relieving the congestion of inflamed mucous membrane.

1 oz. bottle, 3/6.

Ephretuss

A pleasant and effective Syrup of Ephedrine, particularly useful in controlling the spasmodic coughing and vomiting of Whooping Cough. It contains Ephedrine Hydroch. gr. 1/8 in one drachm.

4 oz., 3/-; 8 oz., 5/6; 16 oz., 10/6.

The Complete Antiseptic

Monsol differs radically from all other antiseptics on the market. It attacks *all* germs, whether surface or deep seated, without irritation or injury to the most delicate tissue. Such is its great germicidal power that its effect on the germs responsible for sepsis is ten times greater than that of pure phenol or lysol. Yet it can be applied in effective dilution even to mucous membranes without the slightest risk.

These powerful germicidal properties are possessed by each one of the Monsol products making them the most effective yet produced.

Important Reduction in Price

INSULIN 'A.B.'

TRADE A B MARK **Brand**

Manufactured in England and issued jointly by
THE BRITISH DRUG HOUSES LTD. and ALLEN & HANBURYS LTD.
under licence from the Medical Research Council

We beg to announce an important reduction in the price of Insulin 'A. B.' Brand, the revised prices of which are as follows, and take effect from May 10th.

20 units per c.c. In bottles containing:

5 c.c. (100 units or 10 doses)	·	**2/-** each
10 c.c. (200 „ 20 „)	·	**4/-** „
25 c.c. (500 „ 50 „)	·	**10/-** „

40 units per c.c. In bottles containing:

5 c.c. (200 units or 20 doses)	·	**4/-** each

Prolonged and progressive research continuously directed to the improvement of the manufacturing process has resulted in the present extremely high degree of purity which characterises 'A.B.' Insulin. The absence of protein impurities ensures immunity from any reaction following injections. 'A.B.' Insulin has achieved a world-wide reputation for its absolute reliability and the consistently satisfactory results which it yields. This high degree of purity is being *rigidly* maintained. The reduction in price which we are *announcing* does not involve any departure from the standard, nor the slightest relaxation of the strict scientific and physiological control by which the constancy, sterility and stability of 'A.B.' Insulin are ensured.

Every batch of 'A.B.' Insulin is submitted to and approved by the Medical Research Council.

Full particulars and the latest literature will be sent free to members of the Medical Profession.

ROCK INSCRIPTION IN WHICH ASOKA, KING OF ANCIENT INDIA, ENJOINS UPON HIS PEOPLE TOLERANCE OF ALL CREEDS.—More than 2000 years ago Asoka caused the following remarkable proclamation to be carved upon the rocks. "His Sacred and Gracious Majesty the King honours men of all creeds. . . . A man must not do reverence to his own sect or disparage that of another without reason. Depreciation should be on specific grounds only, because the creeds of other people all deserve reverence for one reason or another. By thus acting a man exalts his own sect, and at the same time does service to the creeds of other people. By acting contrariwise a man hurts his own sect and does disservice to other sects. For he who does reverence to his own sect while disparaging other sects, wholly from attachment to his own and with intent to enhance its splendour, in reality, by such conduct, inflicts the severest injury on his own sect . . . ." In another place he says: " . . . all communities all denominations are reverenced by me with various forms of reverence. Nevertheless, personal adherence to one's own creed is the chief thing, in my opinion." Asoka put his precept into practice in various ways; for example, he built hermitages for a certain sect of ascetics abhorred by the Buddhists in general. These dwellings were carved out of the hardest granite rocks and had beautifully polished walls, the work being carried out by the king's craftsmen at great expense.

VITAMINS A, B & D
HAVE ALWAYS BEEN IN CADBURY'S MILK CHOCOLATE.

Fresh milk only is used in Cadbury's Milk Chocolate, which is made by a distinctive process incorporating the fresh milk direct with the chocolate.

By this process, the important Vitamins A, B and D, natural to fresh milk, are retained.

Owing to its concentrated form (there are 1½ glasses of milk in every ½-lb. cake) the chocolate is appreciably richer in Vitamin D than milk itself. Further, it contains the whole of the bone-forming calcium and phosphates present in the milk. All the essentials of an anti-rachitic food are contained in Cadbury's Milk Chocolate.

The dietetic value of milk has always been recognised by the medical profession—a convenient and concentrated form is Cadbury's Milk Chocolate.

This chocolate is sold in 2d. Bars, 6d. Packets, and 1/- ½-lb Blocks.

FOR THE TREATMENT OF **HAY FEVER** CORYZA, CATARRH, *etc.*

An Address
ON
TUBERCULOSIS AND THE NERVOUS SYSTEM.*

BY
SIR FARQUHAR BUZZARD, K.C.V.O., M.D., F.R.C.P.,
REGIUS PROFESSOR OF MEDICINE, OXFORD UNIVERSITY.

THE title of my address gives me a wide choice of subjects for discussion, a choice which must be limited by the time at my disposal and influenced by the wish to touch upon matters of interest and importance. Before considering the direct results of the invasion of the nervous system by the tubercle bacillus let me call your attention to such changes as may occur in the personality of patients who suffer from tuberculosis of other organs. It would be surprising if changes did not occur, and equally surprising if they did not vary with, and to some extent depend upon, the inherent and acquired characters of the individual. What other factors may be concerned in their production? The psychogenic factor must be admitted, and this, at its outset anyway, can hardly fail to be a depressant in its action. In these days it is scarcely possible for a victim of pulmonary tuberculosis to be ignorant of the nature of his trouble or to be blind to the inferences to be drawn from the diagnosis of consumption or phthisis. The initial phase of depression, born of this knowledge, is not, however, necessarily of long duration; reassurance, the beneficial results of treatment, and possibly the absence of pain, combine to bring about a brighter outlook. But the "spes phthisica" denotes something more remarkable—that is to say, the inability of the patient to realize the gravity of his condition in spite of increasing distress, increasing disability, and all the signs which, to the onlooker, point to only one end: That "hope springs eternal in the human breast" is not a scientific explanation of this phenomenon and is not supported by another quotation from Pope: "Heaven from all creatures hides the book of Fate, All but the page prescribed, their present state." I would submit that in this instance it is the poisonous products of disintegrating bacilli, exerting their influence on the highest nerve centres, which hinder realization of the present state

This suggestion does not seem so far-fetched if we recall the picture of Korsakow's psychosis, a clinical syndrome which in its earliest stages is characterized by a defect of retention for recent events, a lack of insight and some degree of euphoria, accompanied by the ability to converse with clearness, intelligence, and plausibility. In the majority of cases Korsakow's psychosis is etiologically concerned with the abuse of alcohol, but it has been observed in connexion with malaria, typhoid fever, and tuberculosis. In support of the toxic origin of phthisical optimism is the fact that it is more often observed in severe and chronic cases than in patients whose favourable progress would give it justification. In other words, its presence, although merciful, does not warrant a cheerful prognosis.

DISTURBANCES OF NERVOUS FUNCTION.

Most patients suffering from chronic tuberculosis undergo changes in disposition, changes which are common to many forms of invalidism and for which their relations and friends, on the one hand, and their general nervous exhaustion on the other, are mainly responsible. Irritability, lack of consideration, indecision, vacillation, and failure of concentration are all familiar features of any sick-room and cannot be considered pathognomonic.

Psychoses, generally speaking, have no special incidence on tuberculous patients, but the susceptibility of psychotic patients to pulmonary tuberculosis is, of course, well recognized, and the association of mental disorders with tuberculosis in family histories is met with more frequently than can be explained by coincidence.

The evidence for a specific peripheral neuritis of tuberculous origin is not convincing, and I cannot recall a case which gives it support. Multiple neuritis may develop in bedridden patients suffering from septic absorption, and it is difficult to disregard that factor in a case of tuberculosis complicated by secondary infections.

The regulation of the autonomic nervous system is often unstable; pyrexia, sweats, localized vasomotor disorders such as those seen on the cheeks, are significant in this connexion, and a syndrome indicating hyperthyroidism may attract attention. In addition, the cervical sympathetic nerve supply may be involved in the local morbid process and oculo-pupillary phenomena develop on one side.

No physician whose practice is largely concerned with thoracic disease can afford to neglect the study of pains, nor to overlook the significance of painful and tender areas on the surface of the body remote from their site of origin. The pain referred to the shoulder region, accompanied by cutaneous hyperalgesia, when the diaphragm is the seat of disease, is a case in point, and the various locations of headache associated with pathological disturbances in different parts of the lung are more than haphazard in their determination.

So much for some of the casual disturbances of nervous function resulting from the presence of a tuberculous lesion in any part of the body. Such a lesion, however, once established, must be regarded as a potential menace to the nervous system itself, with the possibility of attack either by direct extension through the tissues which form its natural, but not always efficient, protection, or through the medium of metastasis. Of all infections of the nervous system, with the exception of syphilis, the tuberculous is the most frequent, especially during the periods of infancy, childhood, and adolescence.

TUBERCULOMA.

This age incidence is applicable to the occurrence of tuberculomata, which are probably the commonest tumours of the brain in the young. The majority of them are more of academic interest than of practical importance, as they are often small, multiple, and discovered in patients who have succumbed to phthisis or to a secondary meningitis. They are generally located in that part of the brain and brain stem which fills the posterior fossa.

A more important, though less common, problem is presented by a large tuberculoma developing in one cerebral or cerebellar lobe, and giving rise to the characteristic signs and symptoms of an intracranial neoplasm. Such an event may occur in a patient who has an apparently quiescent tuberculous lesion in the thorax and whose general health is more or less unimpaired. A typical example of such a problem is afforded by a case with which I had to deal a few years ago.

A young married woman, about 24 years of age, was under my care in hospital on account of headache, vomiting, and early optic neuritis. She presented physical signs which pointed to a tumour of the right frontal lobe, and others which were unmistakably those of a small tuberculous lesion at the apex of one lung. The probabilities were in favour of a cerebral tuberculoma, but it was quite possible that a growth of some other nature might be responsible for the patient's trouble, and my colleague Sir Percy Sargent agreed to explore the site of disease. He found and removed a spherical hard mass, about the size of a large marble, embedded just beneath the surface of the brain and easily detachable from the surrounding soft tissue. Its consistence and attachment to the pia-arachnoid were more suggestive of some form of meningioma than of a granuloma, but, on section, it proved to be an encapsuled tuberculous abscess or broken-down tuberculoma. Its liquid content included no living pyogenic organisms, and its fibrous wall was nearly an eighth of an inch in thickness.

The operation was one demanding great care and skill in avoiding any escape of fluid from the abscess, or injury to the adjacent structures, but was completely successful in its object. So successful, indeed, that after a long stay in hospital and a convalescent home, the patient was able to return to her family fully restored to health. Unfortunately domestic conditions were unfavourable, the lung disease flared up, and brought about her death a year or two later.

* Delivered to the North-Western Tuberculosis Society in Manchester, on March 21st, 1929.

The risk of setting up an acute tuberculous meningitis in the process of removing tuberculomata must be constantly present to the mind of a surgeon undertaking the task, and considerable judgement is required in deciding on the propitious moment for operation. In some instances it is wise to give the patient a prolonged course of rest and open-air treatment before any attempt is made to eradicate the disease, so long as it is possible to keep him under strict observation and watch the progress of papilloedema and other physical disturbances. Adopting these principles, I have seen at least one large tuberculoma, with a firm capsule and caseous centre, removed from a cerebellar lobe with excellent and lasting results.

Under the microscope tuberculomata of the brain and spinal cord may be recognized by their caseous centres, surrounding which will be found a zone either of giant-celled nodules or of infiltrating epithelioid cells, along with disintegrated nervous elements. Further afield there is evidence of toxic degeneration of nerve cells and often an abundance of granular corpuscles. Neighbouring blood vessels are congested and, where they penetrate the outer layers of the tuberculoma, are found to be thrombosed. The amount of fibrous wall depends on the local reaction of the tissues, the virulence of the bacilli, and the age of the growth.

Chronic Tuberculous Meningitis.

A subject which is of interest, and perhaps of more far-reaching importance than appears at first sight, is that of local chronic tuberculous meningitis or meningo-myelitis. The following story will illustrate its clinical and pathological bearings and emphasize their significance.

A girl, 14 years of age, with a history of having suffered from frequent epileptic attacks during the previous two years, came under my care in St. Thomas's Hospital. Her attacks were of the Jacksonian type, beginning with spasm in one upper limb and following a definite line of march before consciousness was lost. In the intervals the girl was quite well and free from headaches. Examination revealed no physical signs of disease, and there was no story of illness or injury which could be regarded as of etiological importance. A routine *x*-ray examination of the head, however, revealed an unusual picture. There were seen scattered over the precentral convolution of one hemisphere a number of small very dark shadows suggestive of osseous or calcareous bodies, some of which were in a position to account for the epileptic symptoms. Finding that the attacks could not be controlled by bromides, and encouraged by the radiographical findings, I asked Sir Percy Sargent to explore. He discovered an area of chronic leptomeningitis in which a number of calcareous nodules were embedded, and proceeded to dissect the latter away from that part of the motor area which is responsible for movements of the upper limb. The osteoplastic flap was replaced and bromide treatment was resumed with very much more successful results. Many months passed without any attacks, and the child was able to resume her normal life.

Although positive proof was lacking, there could be no doubt that we had to deal with the scars of an old tuberculous meningitis limited to a small surface area of one hemisphere. The calcareous deposits alone enabled the lesion to be detected by the radiologist, and so provided a clue to the pathology of the condition. In the absence of calcareous deposits that clue would have been wanting, and the question naturally arises as to the frequency of localized tuberculous meningitis and its possible bearing on the origin of many obscure cases of epilepsy. In exploratory operations on patients suffering from Jacksonian attacks focal thickenings of the leptomeninges, sometimes associated with small loculated collections of fluid, are not infrequently met with, and it seems quite likely that some of these may be the cicatrices of old tuberculous lesions. Certain it is that calcareous nodules in this situation are very rarely come across, in spite of the general use of radiography in cases such as the one I have described. On the other hand, small tuberculomata may be found in relation to the soft meninges in patients dying from generalized tuberculous infection.

Jacksonian Epilepsy.

Having been led circuitously into the field of Jacksonian epilepsy, I am disinclined to leave it without uttering a protest against the common but fallacious belief that the removal of anything from the cerebral cortex or its meninges is an adequate measure in itself to arrest the disease. It cannot be too strongly emphasized that such a source of irritation is only one factor in the evolution of epilepsy, and that the habit or inclination to "fit" is not only as important, but a great deal more difficult to eradicate. An operation, therefore, should be followed by a prolonged course of bromide therapy if it is to be given any chance of achieving the object for which it has been undertaken. Surgical measures for the relief of epilepsy have often failed in the past on account of ignorance or neglect of this principle, and too much has been asked and expected of them.

Acute Tuberculous Meningitis.

Acute tuberculous meningitis is so common, and so minutely described in all textbooks of medicine, that I shall make no attempt to retail to you its protean symptomatology. Since Robert Whytt of Edinburgh, in the eighteenth century, published his *Observations on the Dropsy in the Brain* its pathological features have been well recognized, and since 1833, when Gerhard of Philadelphia produced his monograph on *Tuberculous Meningitis in Children*, little of clinical interest has been added to our knowledge. But during the last ten years the advent of epidemic encephalitis has made the problem of diagnosis a more difficult one, in that both diseases can display identical symptoms and run very similar courses. When that diagnostic difficulty arises we are often obliged to rely on an investigation of the cerebro-spinal fluid in order to overcome it, and a short space of time will not be wasted in considering the information which can be derived from a lumbar puncture.

The fluid in tuberculous meningitis is usually clear, although in the later stages of the disease it may display a faintly yellowish turbidity. It always comes away under increased pressure, and, if allowed to stand, develops a fibrinous coagulum in the meshes of which a few tubercle bacilli can usually be detected. The cytology of the fluid is characterized by an increase of cells, chiefly, but not all, of the small lymphocytic variety, which may vary in number from 25 to several hundreds per cubic millimetre. Other cells, such as macrophage, large mononuclear, and plasma, are found in much smaller numbers in most cases. The amount of protein, always increased, varies from 30 to 200 or 300 mg. in 100 c.cm. of the fluid, and tends to rise in the course of the disease. Globulin reactions are usually positive. Glucose and the chlorides are progressively reduced in quantity, and the chlorides in particular may reach a lower level than is met with under any other pathological condition.

In encephalitis, on the other hand, the fluid is always clear except for the occasional presence of blood, and no coagulum ever forms unless haemorrhage has taken place. Its pressure is only moderately raised, and if cells are present in excess they are almost entirely of the small lymphocytic variety, and rarely number more than 80 or 100 per c.mm. Protein and globulin are generally within normal limits. The same remark applies to the chlorides, but glucose is often slightly increased in amount.

These are the essential features of the fluid obtained by lumbar puncture in the two diseases, and they afford a most competent guide to diagnosis when we are faced with an acute febrile condition in which there is evidence of diffuse and scattered lesions disturbing various functions of the central nervous system. A differential diagnosis based on the clinical picture alone is often difficult, sometimes impossible.

Another fairly common disease in children which may, in its early stages, give rise to a suspicion of tuberculous meningitis is that due to the virus of poliomyelitis and poliomyelitis. Symptoms and signs of meningeal irritation, in the form of headache, head retraction, and diplopia, with stabismus, are very frequent, and are often associated with vomiting and fever. The cerebro-spinal fluid in the pre-paralytic stage may afford help in arriving at a correct diagnosis. Its important features are a considerable increase of cells, from 30 to 1,500 per c.mm., in which the large majority are polymorphonuclear. Protein may or may not be slightly increased, while glucose and the chlorides remain normal. Changes in the cytological

picture rapidly appear, and in the course of a few days the cell count may reveal a large percentage of lymphocytes and a comparatively few polymorphs. But in spite of this lymphocytosis the glucose and chloride content is not diminished. In fact, the maintenance of the normal quantity of the chlorides must be regarded as strong evidence against the presence of increasing meningeal inflammation. The importance of this is further emphasized by the fact that in cases of poliomyelitis, as in cases of tuberculous meningitis, there may be seen a fibrinous coagulum which develops when the fluid is kept standing, and which is never met with in cases of epidemic or lethargic encephalitis.[1]

The value attaching to examinations of the spinal fluid in the diagnosis of tuberculous meningitis is much increased when this disease occurs in older subjects. In adults the clinical picture often differs from that seen in infants, and sometimes presents great difficulties. I refer particularly to its insidious onset, long-drawn-out course, the slight or absent fever, and the prominence of mental as opposed to physical disturbances of function. It must be within the recollection of most of us to have met with cases of this kind in which the diagnosis has only been arrived at after much delay.

The prognosis in acute tuberculous meningitis when it is only a part of a general miliary tuberculosis is as bad as it can be. But the same cannot be said when the spread of infection is limited to the nervous system, and the diagnosis of tuberculous meningitis, even when acute, does not always justify a hopeless outlook. I have seen more than one patient recover, and careful review of this subject some years ago led A. E. Martin to these conclusions:

> 1. That undoubtedly long remissions and even recoveries do occur in tuberculous meningitis.
>
> 2. That recoveries are possibly more frequent than has been believed, since no fewer than twenty established cases have been recorded since 1894, together with a number of others in which the same definite proof has not been afforded.
>
> 3. That in these cases either the resistance of the individual is so much greater than usual that the disease is checked early in its course, or the virulence of the bacilli is so much less than usual that the lesion in the meninges becomes localized and undergoes a fibrous change.

On the other hand, he goes on to say "that the lesion in the meninges may at a later period form the focus of a fresh infection which usually terminates fatally, and that consequently the prognosis in these cases must be guarded."

Martin, as was natural, regarded the discovery of tubercle bacilli in the cerebro-spinal fluid as the fundamental evidence requisite for establishing a correct diagnosis. Later writers have shown that bacilli are discoverable in almost 100 per cent. of cases if care and skill are employed in the search for them.

Tubercles in the choroid were of more importance in the diagnosis of tuberculous meningitis before lumbar puncture became part of a physician's equipment. They were first seen with the ophthalmoscope by Jäger in 1855, but their presence cannot be regarded as sufficiently frequent to afford much help, and their absence cannot be advanced as an argument against the diagnosis of tuberculous meningitis. Moreover, it must be remembered that they have been observed in tuberculous subjects without other evidence of involvement of the nervous system. Although of little practical importance, therefore, they nevertheless provide us with the only opportunities for seeing isolated tubercles during life, and the white, yellowish, or reddish-yellow, rounded spots with pale centres are very characteristic when they come under observation. As a rule they cause no symptoms, although transient disturbances of sight have been recorded.

SPINAL CARIES.

No consideration of tuberculosis in relation to the nervous system would be complete without reference to Pott's disease of the spine, or spinal caries. That cases of this disabling disease have become less numerous and less disastrous during the last quarter of a century can hardly be denied, and the credit for that blessing may be frankly given to those who are concerned principally with the preventive side of medicine.

Percival Pott was a surgeon on the staff of St. Bartholomew's Hospital whose name might not have been known to posterity except for two reasons. In the first place, he was fortunate enough to fall in the street and sustain a fracture of the fibula which thereafter bore his name. As the result of the enforced leisure consequent on this accident he took to writing, and some years later, in 1779, produced his epoch-making pamphlet on palsy from spinal deformity. In the second place, he earned our gratitude for being the man from whom John Hunter derived not only much of his medical knowledge, but his inspiration for pathological research.

Pott, however, did not really describe the tuberculous nature of his disease, which had been surmised by Hippocrates and Galen, but drew attention to the characters of spinal deformities and their sequelae. The tuberculous origin of spinal caries was finally established by a less fortunate Frenchman, Delpech of Toulouse, the pioneer of orthopaedic surgery in that country. He met a violent death at the hands of a patient on whom he had operated for varicocele and who thought he had thereby been rendered unfit for marriage.

So much for the romance of Pott's disease. It has another aspect worthy of our notice in the question of its treatment, the guiding principles of which demand some acquaintance with the pathology of the disease and with the mechanism of compression paraplegia.

Spinal caries is an osteomyelitis of the vertebrae commencing either in the cancellous tissue of the body close to an intervertebral disc or at the root of the laminae. Much erosion of the body may take place, with or without resulting deformity and without disturbance of the spinal cord. In the same way an abscess, arising from a small focus of bony disease, may track in various directions and attain a great size without the development of a kyphosis or paraplegia. On the other hand, paraplegia may be the first symptom of the disease without obvious abscess formation or angular curvature.

Speaking generally, it is not often that bony deformity alone produces paraplegia, nor is the presence of a psoas or lumbar or retro-pharyngeal abscess necessarily associated with nervous symptoms. Compression usually results either from an abscess bursting through the posterior common ligament or from tuberculous granulations filling up the epidural space and forming a cuff of dense tissue around the dura mater. As a consequence of this strangulation the subarachnoid space may be completely obliterated and the vascular supply of the cord seriously interfered with. Only rarely does the displacement of a sequestrum backwards from a diseased vertebral body cause direct pressure on the cord, or a sharp kyphosis bring about a kinking of that organ.

In deciding on the appropriate line of treatment for any particular case, all these pathological processes must be passed in review and the attempt made to assign the paraplegia to one or more of them. It is of paramount importance to remember that the injury done by compression largely depends on interference with vascular supply, which leads to ischaemia, softening, and finally sclerosis. Unless the circulation can be restored and maintained, return of function is impossible, and the longer circulation is inadequate, the less chance is there of an ultimate success for treatment. Therefore, before deciding on rest and extension as the measure to be adopted, every effort should be made to exclude the presence of such compression as will not be relieved by that form of treatment. An abscess inside the vertebral canal may need evacuation, or a simple decompression may suffice when the epidural space is filled with granulomatous tissue.

On the whole, it is true to say that caries in children is more often cured by simple rest and extension than it is in adults, but every case must be considered on its own merits and in the light provided by the known pathology of the disease.

THE TREATMENT OF CARCINOMA OF THE CERVIX WITH RADIUM.

BY

GILBERT I. STRACHAN, M.D., M.R.C.P., F.R.C.S.,

ASSISTANT OBSTETRICIAN AND GYNAECOLOGIST, CARDIFF ROYAL INFIRMARY; FIRST ASSISTANT TO PROFESSOR OF OBSTETRICS AND GYNAECOLOGY, WELSH NATIONAL SCHOOL OF MEDICINE.

THE wide prevalence and extreme malignancy of carcinoma of the cervix are well appreciated by all practitioners, and any method of treatment which promises cure or alleviation calls for careful investigation.

In operable cases the results of surgical excision, especially in expert hands, have been of great benefit, and many lives have been saved by this method. But it is common experience that in many cases presenting themselves for the first time for examination the disease is advanced beyond the possibility of operative removal. This "operability rate" is estimated with considerable variations in different centres and according to the personal leanings of different surgeons. Bonney finds only 36 per cent. of his cases inoperable, while in the Cancer Hospital, London (Cole), the percentage is quoted at from 88 to 93, and other centres quote intermediate figures. Taking involvement of the adjacent vaginal wall as a useful criterion of inoperability, we find in Cardiff that 90 per cent. of our cases of carcinoma of the cervix are inoperable when first seen. For the alleviation of these advanced cases many palliative remedies have been advocated, and the most important of these is exposure to the gamma rays of radium. It is our experience with this method of treatment in advanced cases of carcinoma of the cervix that we wish to discuss in this paper.

THE ACTION OF RADIUM.

It would be out of place in this article to discuss the physics of radium, but the clinical effect on tissues can be considered. In general terms the action of radium is to produce cellular death, but this effect varies within wide limits with the amount of radium used, the duration of exposure, and the type of tissue involved. The destructive effect is most marked in the case of embryonic cells, as in a malignant growth, or in the Graafian follicles of the ovary; it is less marked in the more mature cells of a benign neoplasm, and is least marked in the case of the adult type of cells forming the parenchyma of organs.

The important point now emerges that the more malignant a tumour the more susceptible is it to the destructive action of radium (Bergonié and Tribondeau), and several workers, such as Ewing, Martzloff, Broders, and others, have attempted to judge from the degree of malignancy or anaplasia of the cells of tumours the degree of radio-resistance or radio-sensitiveness of these tumours, and the corresponding likelihood of radium being effective as a remedial agent or the reverse. These researches have not been of great practical value, and at present we know of no criteria by which the effect of radium on a given carcinoma can be foretold.

The exact manner in which radium produces its lethal effect is not yet known. It may be by a direct action on the tumour cells, or by an indirect action, such as by the production of thrombosis or of antibodies. Ewing is of opinion that the constituents of the cells are ionized and the intercellular ferments stimulated, while Dixon points out that radium has a marked effect in decomposing lecithin; and it is just those tissues which are rich in lecithin which are most affected by radium. The cellular degeneration may therefore be due to the effects of the decomposed lecithin. The known action of radium in producing thrombosis must also be kept in mind as at least a contributory factor in this respect.

The clinical changes occurring in a carcinoma of the cervix reacting satisfactorily to radium have lately been summarized by Farrar of New York as (1) hyperaemia one week after the application; (2) slough formation on the surface of the cervix three weeks later; (3) separation of the slough one month later; (4) a stage of contraction due to fibrosis after another month; and (5) a final stage of marked upper vaginal and cervical contraction. These findings are in general accord with our own experience, but the time factors have been found to be somewhat more variable than those stated. The histological changes occurring as the result of irradiation have been described by several writers, and need not be gone into here.

PRELIMINARY EXAMINATION.

While irradiation is the treatment of election in advanced cases of carcinoma of the cervix, not every case in this category is suitable for radium, and for this reason alone it is necessary to carry out a careful preliminary investigation in every case which it is proposed to treat by this agent. The following points call for investigation.

1. *The general condition of the patient* is important. A cachectic and emaciated patient is a poor subject for radium, which in such a case may do more harm than good. In these cases radium should be withheld until the general condition has improved, if it is going to improve, by rest and appropriate feeding.

2. *Anaemia* from repeated haemorrhages or from toxic absorption from a foul cervix should be looked for in every case. In general it can be laid down that, with a red cell count of 3 million or under, or with a haemoglobin index below 40, radium should not be applied on account of the danger of still further increasing the anaemia.

3. *Extensions* of the disease should be investigated. Tenderness and swelling in the loins would indicate hydro- or pyo-nephrosis from ureteral obstruction, and would constitute a contraindication to irradiation. Increased liver dullness, especially if associated with jaundice, points to secondaries in this organ, while suprapubic swelling might point to pyometra.

4. *The local condition* is to be carefully examined, if necessary under anaesthesia, and the size, character, and extent of the tumour accurately estimated, as well as the degree of parametrial infiltration and uterine fixation present. The size of the uterus is important: if enlarged it may indicate pyometra, and in such a case careful uterine exploration should be carried out. The fornices should be carefully palpated for any signs of salpingitis, pyosalpinx, or pelvic abscess. It has to be emphasized that *in the presence of any inflammatory pelvic lesion*, such as a foul carcinomatous ulcer, pyometra, pyosalpinx, or pelvic abscess, *radium should not be applied* until the condition is cleared up, *owing to the risk of* setting up peritonitis.

5. *Involvement of rectum or bladder*, as indicated by symptoms of tenesmus, dysuria, or bleeding, or as found on *physical examination*, would *constitute contraindications* to irradiation. The disease is far advanced in such cases, and the effect of radium would be merely to hasten fistula formation. It follows that the presence of a definite fistula into either of these organs, especially into the bladder, would render the case unsuitable for radium. Occasionally radium may be applied in the presence of a small rectal fistula, but never in the presence of a vesical fistula.

Only after a thorough preliminary examination of this nature should radium be applied.

TECHNIQUE OF APPLICATION.

In different clinics in this country, on the Continent, and in America considerable variations exist regarding the amount of radium to be applied, the duration of dosage, and the manner of insertion. The technique here described has been evolved by us since 1922.

Before radiation the vagina is douched twice daily with weak lysol, and the rectum cleared as for perineorrhaphy. If the surface of the carcinoma be foul, radiation is postponed and douching continued until it is clean.

With the patient under anaesthesia in the lithotomy position, a final bimanual examination is made to verify the points mentioned above, and after exposure with a speculum the cervix and vagina are thoroughly swabbed with tincture of iodine. If possible, the cervix is now gently steadied by vulsella, but in advanced cases there may be no cervix left owing to extensive ulceration. A section of the tumour, if possible with a piece of the adjacent healthy tissue, is now taken for microscopical examination.

A sound is then passed through the cervical canal in order to determine the position of this in the ulcer, to estimate the size of the uterine cavity, and to explore for the presence or absence

of pyometra. If pyometra be present the cervix is dilated and the condition drained, while radiation is postponed until the uterine discharge has ceased. It may be very difficult, and in some cases impossible, to find the cervical canal in the midst of the carcinoma, but prolonged and gentle attempts should be made for the reasons stated; in such difficult cases the canal is often to be found at some point in the periphery of the growth. One 50-mg. tube of radium sheathed in platinum is then introduced with Pinch's forceps well up the cervical canal; if the growth extends particularly to one or other side a tube of 25 mg. is inserted in this extension, while round about the periphery of the tumour five or six 10-mg. tubes are buried. The 50 and 25 mg. tubes are 2.5 cm. in length, and the 10-mg. tubes are 1.7 cm. in length. They are of platinum, and one end is pointed, while at the opposite extremity is an eye through which a length of silk is threaded. These radium tubes should be inserted well up into the substance of the growth.

The silk threads from the eyes of the radium tubes are then knotted together, and this strand is tied to the end of a roll of gauze, which is firmly packed into the vagina, especially into the anterior and posterior fornices, so as to keep the rectum and bladder as far from the effects of the radium as possible. Finally, a self-retaining catheter is passed into the bladder.

After twenty-four hours the catheter and packing are taken out, and along with the latter the radium tubes are easily removed by gentle traction. Another vaginal douche of lysol is given.

The amount of radium inserted therefore depends to some degree on the extent of the lesion, and in this respect we fully agree with Ward of New York, who maintains that every case is an individual study, and that no definite dosage can be laid down for all cases. The usual dosage is from 125 to 150 mg., and this, left in for twenty-four hours, represents a milligram-hour dosage of from 3,000 to 3,600.

Daily douches are given, and the patient is allowed up in a few days, and usually goes home by the end of the week. She is instructed to give herself a daily vaginal douche until she reports again for examination in four weeks' time. This is beneficial not only in keeping the parts clean but also in the prevention of vaginal stenosis. The patient is examined again in a month and after that at intervals. Further irradiation depends entirely on the reaction of the tumour to the first insertion. In some cases it has been found that a single irradiation produces a beneficial and evidently permanent effect, while in other cases several applications have been required.

Deep x-ray therapy, applied either to or subsequent to local radiation, is now being used in a number of clinics. While it is difficult to find any figures to show improved results from this therapy, it is likely that in the future this will form an important adjunct to local radiation, especially with improved technique of application. The main objection to deep x-ray therapy has been that the action is not localized to diseased tissues, and that healthy organs, such as the bowel, may be affected, with resulting gangrene and perforation. These accidents have happened, but with more modern and improved technique it is likely that this aspect will be eliminated and the rays concentrated more especially on the diseased parts.

Clinical Results.

In considering these it will be seen that the majority of patients with carcinoma of the cervix treated by radium have died at varying intervals. But in this connexion it has to be remembered that all these cases were advanced when first seen, with involvement of the vaginal walls, and mostly with impaired uterine mobility and parametrial infiltration. They were inoperable by any usual clinical standard, and under these circumstances a high mortality is to be expected. It has to be emphasized that no patient died as the result of irradiation.

In discussing results it is unsafe to use the word "cure," as experience has shown that a number of cases apparently cured recurred even after several years, and it is better to use such terms as "alive" or "free of symptoms" in describing such cases.

Since we started using radium in this condition, late in 1922, 153 cases have been treated, and of these 40 are now alive, while 113 are known to be dead or have failed to report. It may be stated in passing that, as the result of the help which we obtain from the Cardiff, Glamorganshire, and Monmouthshire health authorities, no case has been lost sight of for the last three years, and we acknowledge our deep gratitude to these bodies. The cases (40) still alive may be tabulated as follows:

	Total Cases Treated.	Number Alive.	Percentage Alive.
First treatment:			
Over 5 years ago	26	0	0
" 4 " "	43	3	6 9
" 3 " "	72	5	6.9
" 2 " "	93	8	8.1
" 1 year ago	117	14	12.1
Less than 1 year ago "	153	40	26.5

Of the other 113 cases, 89 are known to have died, while 24 have been lost sight of. While it is certain that at least the majority in this category of "failed to report" have died, they cannot be included for statistical purposes. These 89 cases can be tabulated in this way:

Duration of Life since First Irradiation.	Number of Cases.
Over 5 years	2
" 4 "	2
" 3 "	3
" 2 "	6
" 18 months	6
" 12 "	15
" 6 "	25
Under 6 months	30
	89

The average duration of life in these patients who died was 13.2 months.

Practically all the deaths occurred after discharge from hospital, so that in very few cases were post-mortem examinations obtainable. The reported cause of death was usually increasing weakness from toxic absorption or ascending renal infection (especially in cases where vesico-vaginal fistulae had developed). Rarer causes were intestinal obstruction (2), pyaemia, and secondary anaemia and general exhaustion following the development of a large abscess in the buttock (1 each).

Relief of Symptoms.

Apart from the saving of life, an important feature in the successful use of radium is the amount of relief obtained from the distressing symptoms of uterine haemorrhage, foul discharge, and pelvic pain, and it is our opinion that even if life were not prolonged by a day irradiation would be justified in its use for this reason.

Haemorrhage was controlled in 90 per cent. of the cases; in 10 per cent. it recurred before death; and in 80 per cent. it ceased permanently. Vaginal discharge ceased in 60 per cent. of cases, and was improved in another 15 per cent. Pelvic pain was relieved in 45 per cent. of cases; in 30 per cent. it was not influenced; and in 25 per cent. it was aggravated or appeared for the first time after irradiation.

Conclusions.

It is obvious from the foregoing that, while radium cannot as yet be described as a certain and definite "cure" in all cases of carcinoma of the cervix, the results are encouraging, taking into consideration the initial extent of the disease in the cases reported. It has to be remembered that this treatment is in its early stages, and with improved technique, especially as regards the subjecting of all the primary and secondary tumour cells to the immediate effects of radium, improved figures are confidently to be expected. There is a vast field here for investigation and research, which is being energetically carried out in many centres. As a palliative agent, however, radium is the most potent that we possess, and in this way alone it has abundantly justified its use in the relief of the distressing symptoms of the condition.

I feel compelled, in conclusion, to protest against the manner in which radium has been hailed as a "cure for cancer" by certain sections of the lay press. Much false hope and subsequent disappointment have been created by this propaganda, and although funds have in some cases

been obtained for hospitals for the purchase of radium by these means, scientific and clinical progress has been correspondingly embarrassed.

The main hope of advance in the treatment of carcinoma by radium lies in the combined investigations of the clinician, the pathologist, and the physicist, and it is in this way only, and not by startling newspaper headlines, that future clinical results are likely to improve.

TECHNIQUE OF INTRA-ABDOMINAL INSERTION OF RADIUM FOR CARCINOMA OF THE CERVIX UTERI.

BY

MALCOLM DONALDSON, M.B., F.R.C.S.,

PHYSICIAN ACCOUCHEUR WITH THE CHARGE OF OUT-PATIENTS, ST. BARTHOLOMEW'S HOSPITAL.

IT will be many years before the public is sufficiently educated in medical matters to realize that periodic overhauls of their bodies are as necessary as for their motor cars. For a long time, therefore, there will be a large number of patients with advanced cancer, especially carcinoma of the cervix.

In discussing the problem of cancer treatment it is of some importance to consider why an advanced case of malignant disease should be more difficult to cure by radiotherapy than an early case. When dealing with "excisional surgery" it is easy to realize that if the diseased area is extensive it will be impossible with a knife to cut this out without excising portions of essential organs, with fatal results to the patient. In radiotherapy, on the other hand, it is not so easy to be certain why there is such difficulty in destroying malignant cells placed deep in the pelvis when it is so easy to destroy them if placed on the tip of the cervix. There are several possible explanations for this difference.

First, it may be the better blood supply that is found in the region of the deeper part of the growth: Strangeways and Fell found that the reaction of tissues in the embryonic chick to x rays differed considerably before and after circulation had been established.

Secondly, it is possible that the cancer resistance of the body materially helps the radiotherapy in early cases, but that in the more advanced cases no such help is forthcoming. This idea is very seriously considered in Sweden.

Thirdly, the type of cell developed in these late cases may in itself be more radio-resistant; this, however, is hardly likely, as the cells in the cervix and more exposed part of the growth are just as easily destroyed in the late stages as in the early cases.

Fourthly, there is the simple explanation that it is more difficult to apply an efficient dose to these more distant cells. It is with this simple explanation in view that I am at the present time treating a series of patients by means of intra-abdominal radium.

It is to the Brussels Radium Institute that we owe the first attempt along these lines. The technique they used in 1919 consisted in putting the patient in the Trendelenburg position, opening the abdomen, and, when the posterior layer of the broad ligaments had been incised, placing 20 mg. of radium element in a single tube at the base of each ligament. In addition to this they sometimes put needles into the uterus. The sutures from these tubes were carried out through the lower end of the abdominal incision, and the whole pelvis was packed with 6 to 8 yards of gauze. At the end of four or five days this was removed, with or without an anaesthetic. I modified this technique by using needles instead of tubes. Thirteen cases were treated with a modified technique during 1923-24. Of these thirteen cases:

One was of the first degree and is living and well after four years.
Four were of the second degree, and of the four cases two are living after five years, although the latest report from one is not very satisfactory. Two have died, one after fourteen months and the other after seven months.
Six were of the third degree; three of these six are living after five years or more, and three have died, having lived less than one year.
Two were of the fourth degree; one is living after five years and the other died after a year and ten months.

It will be seen, therefore, that of the thirteen cases six are alive after five years, and one has lived for four years and shows no signs of the disease.

Present Technique.

The intra-abdominal insertion of radium is usually carried out about six to eight weeks after the vaginal application—that is to say, when the local external growth has disappeared and all ulceration healed. No attempt so far has been made to combine the intra-abdominal application at the same time as the vaginal, merely on the theoretical grounds that, whilst there is an infected area in the cervix and fornices, it is perhaps not wise to do anything to the abdomen and parametrium which might lower the resistance to that infection.

The patient is put into the Trendelenburg position and the abdomen opened, a general examination is made of the liver and aortic glands, in addition to the pelvic organs and the iliac glands. The intestines are packed off and the uterus is pulled forward; the parietal peritoneum is then picked up with forceps and the needle inserted, leaving only the eye of the needle protruding from the peritoneum. The suture is put through a small portion of the peritoneum below the level of the needle eye, and the knot tied over a glass bead to prevent cutting through the thin peritoneal tissue.

The needles are placed at a distance of 1 to 1½ cm. from each other, starting at one sacro-iliac synchondrosis and ending at the corresponding joint of the opposite side. In addition four, or possibly more, needles are placed in front of the broad ligaments in the hope of eradicating the disease from the obturator glands. The ends of the ligatures are tied together and pushed down into the pouch of Douglas. The abdomen is sewn up completely and the radium left *in situ* for seven days. At the end of this time the abdomen is again opened and the radium removed.

An objection to this technique is the second laparotomy at the end of a week, but up to the present it has been felt that in order to keep them in position the needles should be sutured to the peritoneum, which makes it impossible to pull them out. In addition to this they are often placed at an angle to the line of traction, and damage might be done if pulled out blindly. Dodd of the Westminster Hospital has modified this technique by using radium needles in catheters placed retro-peritoneally so that they can be withdrawn through stab incisions. In addition he combines this with excision of the glands.

Immediate Results.

The first case chosen in this series was a patient (second degree) in whom it was considered there was a reasonable chance of the treatment being of some value, and the operation took place in October, 1927. Three or four months were allowed to elapse in order to see if there were any untoward symptoms before attempting the technique again. At the end of this time the patient was found to be extremely fit. During the year 1928 twelve other cases were treated in a similar manner. Of these, three were diagnosed as being first degree, two were of the second degree, two of the third degree, and five were of the fourth degree.

Of the first degree patients there is little to be said except that on opening the abdomen one of these was found to have enlarged obturator glands. The operation was done in September, 1928, but in December a letter stated that she did not feel very fit, and she died in February, 1929. Another, operated on in June, is very

well at the present time. The third, operated on in July, 1928, has vague pains, but appears to be doing well. The two patients diagnosed as second degree are both doing well.

Of the third degree patients one, operated on in March, has died recently. This patient is of particular interest because when she had her vaginal application it was noticed that there was a swelling in the region of the right kidney. At the intra-abdominal operation it was found that this swelling was due to a hydronephrosis, which seemed to be caused by the pressure of the growth round the ureter. In spite of this the patient wrote in December, saying, "There is no doubt my health generally is greatly improved. I feed regularly and have regained much of my lost weight."

Of the fourth degree patients one had a slight degree of intestinal obstruction and masses of glands were found in the pelvis; a colostomy was performed and radium was inserted. She has since died, and there is no evidence that the radium improved her condition.

Another late case was admitted in April, 1929. The patient was so anaemic that a blood transfusion was carried out before putting the radium in per vaginam. She had an ulcer of the cervix two inches in diameter, involving the fornices. Two months later the vagina had completely healed and an intra-abdominal operation was carried out. Glands were found near the aorta, which felt hard and were probably malignant. In December there was marked induration in front of the rectum, but the patient was extremely fit considering her original condition. In another very advanced case the patient was treated in May and was found to have pus in Douglas's pouch. Radium, however, was inserted, and there is little doubt that this was an error of judgement, as, in spite of drainage, the patient got general peritonitis and died as a result of the operation.

The next patient in this series was operated on in September and found to have large masses of glands, some the size of a walnut. It was realized that it was not possible to effect a cure, but it was thought that if those near the uterus were diminished in size it might reduce the amount of pain at a later date. The needles were therefore concentrated on those glands. In December the mass of glands did not seem to be diminished and the patient was obviously not so well.

The last of the fourth degree patients was treated in December. Considerable adhesions were found in the pelvis but no markedly enlarged glands. There was, however, much induration in both the broad ligaments. Following the removal of the radium there was a certain amount of wound infection, but this cleared up and the patient left hospital in fair condition.

It will be seen, therefore, that of the 13 cases 9 are living, but it is too early to say much about their condition.

Conclusions.

Since it has been proved beyond doubt that radium will entirely eradicate carcinoma in the cervix and vagina it is logical to try and extend the influence of the radium to the growing edge of the tumour by means of intra-abdominal radium. The cases so far treated show that this method is not attended by any undue risk to the patient, and the small series treated in 1923–24 show sufficiently good results to justify us in investigating further this line of treatment.

RADIUM TELETHERAPY: EXPERIENCE WITH A TEMPORARY "BOMB."

BY

FRANCIS ROCK CARLING, B.Sc.LOND.,

TECHNICAL ADVISER FOR RADIUM WORK, WESTMINSTER HOSPITAL.

Few medical men are unaware of the excellent results of radium treatment of primary growths and accessible glandular metastases by needles and seeds, but only those constantly employing these methods are fully awake to their limitations. If local and accessible manifestations can be successfully treated with gamma rays, so also should the inaccessible lesions; and therefore until the difficulties of producing x-radiation of a sufficiently high frequency have been overcome radium teletherapy must be provided.

It is well to follow the line of thought that has led to the technicalities of teletherapy. Whatever be the view taken as to the mode of action of gamma rays on normal or cancer cells, the treatment is substantially the same. An attempt is made to dose the cancer adequately without overdosing the patient, and to this end the cancer is irradiated more intensely than the rest of the body whenever possible. The dosage, measured as it is in milligram hours or millicuries destroyed, is a measure of available energy of which as a rule only a small proportion is absorbed by the cancer, and a larger by the surrounding tissues. The cancer itself can be adequately dosed by widely varying values of intensity and time, but the patient stands the best chance of recovery only when those values are suitably chosen. The usual method of placing needles or seeds interstitially provides economically a more intense irradiation in the growth than in the surrounding tissues; it is also possible in a large measure thus to provide the optimum intensities, but it has been found that local applications are by no means always sufficient, and in practice an attempt is made to irradiate more generally from over the lesion by the so-called "surface application." This system, employing radium at a short distance from the skin, usually about 15 millimetres, is elementary teletherapy. Surface application is usefully employed only when the lesion is close to the skin. To extend the system to the treatment of deeper manifestations Sluys of Brussels uses radium similarly at a distance of 5 cm. from the skin, and in teletherapy proper the radium is employed at distances as great as 16 cm. This has given rise to the belief that gamma rays penetrate to a greater depth when the source is farther from the surface. It is of course quite erroneous; but greater distance does enable us to irradiate usefully to a greater depth, for the reason that the necessary intensities can then be maintained without producing destructively high skin and upper-layer intensities.

The intensity of irradiation is reduced in proportion to the square of the distance from the source, and also by absorption in the tissues. Evidently, then, the intensity near a needle is very much greater than it is at a distance. For this reason, while the intensity between two needles may be insufficient for the desired reaction, radium necrosis may yet be produced close around them, even when all but a minute percentage of beta particles are excluded. An average of the effective minimum intensities employed with needles is approximately that intensity which is produced at the surface of a sphere of 1 cm. diameter when 1 mg. of radium is placed at its centre. This intensity is here called the "standard needle intensity." It is likely that where, as in teletherapy, the practical difficulties of placing the needles accurately enough to maintain this value are entirely eliminated, then half this intensity produces the same reactions; and experience shows that this intensity must be available at the greatest depths.

A concrete example will serve to compare the four radium arrangements mentioned.

The lesion is supposed to be two inches in diameter and three inches in length, the longitudinal axis being at a depth of 10 cm. To maintain the standard needle intensity with the usual needle technique from 30 to 40 mg. are required. Using surface application to produce half this intensity, 600 mg. would be required; with the radium at 5 cm. from the skin some 1,000 mg.; and if skin-radium distance is increased to 16 cm. the amount would have to be more than 2,600 mg. to maintain that intensity. The economy of the interstitial method is obvious.

The relation between the intensity at a depth and that at the skin is known as the "relative depth intensity." This value for the above lesion, employing needles, is from 24 to 32; employing surface application 1/170; radium at 5 cm. 1/16; and radium at 6 cm. 1/5.6. It is assumed that in the three latter methods only a single point source is employed in each case. It is impossible with them to irradiate the lesion more intensely than the surrounding tissues; indeed, the reverse is the case, but it has been

found that a relative depth dose of 25 per cent. for a depth of 10 cm. may be satisfactorily employed. This is the case when the radium is a point source at a distance of 16 cm. from the skin.

A patient irradiated by gamma rays does not appear to be harmed by them if the intensities are reasonable. On the average the deleterious effects upon the blood are less than might be anticipated, but there are important exceptions, particularly when irradiation includes such organs as the spleen, liver, heart, and bone marrow; moreover, the greater the volume irradiated the greater the effect. In cases where the dosage involves a high intensity and a prolonged time, and where in addition the general health of the patient is bad, the effects upon the blood and metabolism generally are serious, and, indeed, success or failure may be determined by them before the cancer has received its essential treatment. This is true of all radium treatment, but more so with teletherapy than with the usual needling, because, while dosing the cancer equally with either system, the patient absorbs more energy by teletherapy. With needling there is no means of preventing irradiation of the patient while irradiating a cancer, but there seems to be no necessity. With teletherapy the irradiation can within certain limits be restricted to desired fields—that is to say, it is often possible to irradiate the cancer without also irradiating the susceptible organs. This is accomplished by means of screening. The irradiation of a patient will be reduced to a minimum when those rays only which traverse the cancer are permitted to enter the body. In practice, even if an accurate knowledge of the position and extent of growth were available, it would not be possible either to shape the "beam" to fit the growth, or to direct it with the necessary accuracy. It is probable, therefore, that in the case of the lesion already considered a clearance around the growth of at least one inch would be essential. If this be the case the absorption of energy by the growth would represent about 4 per cent. of that in the "beam," and the absorption by the body some 60 per cent. Since the beam itself carries but one-sixtieth of the available radiation, it follows that but 1/15 per cent. of the available radiation is "usefully" employed. With needling some 6 per cent. would be similarly employed and about 50 per cent. absorbed by the body.

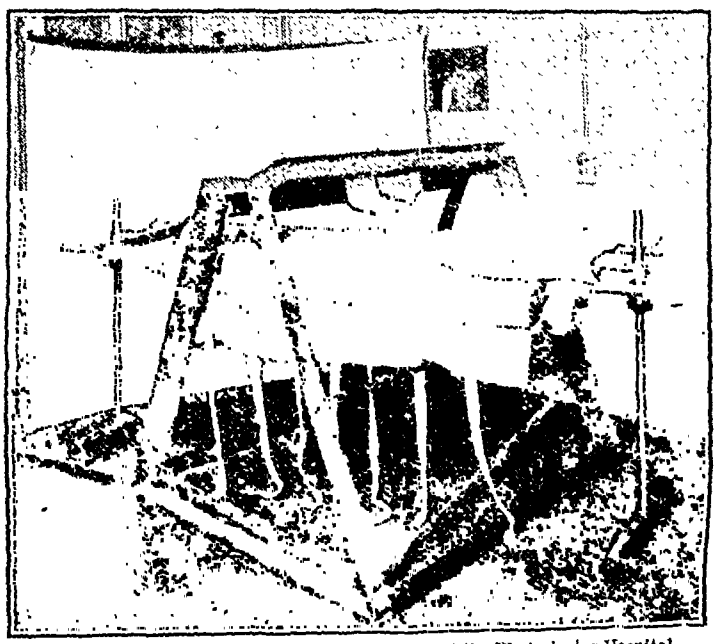

FIG. 1.—Radium teletherapy apparatus in use at the Westminster Hospital.

To obtain the highest value of relative depth intensity from a single point source without increasing the skin-to-radium distance, it is desirable to employ only gamma rays of high frequency. This can be partially accomplished by filtration, because the lower frequencies are more easily absorbed. The filtration should not, however, be increased much beyond the equivalent of 1 mm. of platinum, an amount in general use on the Continent, in the interests of economy. The low penetration of the beta particles prevents any derived directly from the radium having any effect upon deep cancers; they are, in fact, entirely harmful, especially to the skin. For this reason, too, it is undesirable to reduce the filtration below the value already mentioned.

In the interests of economy it is desirable that the radium-skin distance should be less than 16 cm., but at the same time the relative depth intensity must remain at least as high as 25 per cent. at a depth of 10 cm. This can be accomplished by the use of several sources so arranged that while the cone of rays from each passes through a separate area of skin, they all cover the area of the cancer. If this is accomplished the relative depth intensity for each cone can be multiplied by the number of sources to give the relative depth intensity for the whole system. It will, however, be obvious that unless the sources are very widely separated there will be zones of high intensity in the upper layers beneath the skin where the various cones intersect. Fortunately, these tissues are not, as a rule, anything like as susceptible as the skin, so that unless extremely short skin-radium distances are employed it is safe to assume that if the skin has been provided for, so has the intervening tissue.

This multiple source system is known as crossfire. It has been exploited by Sluys, who employs thirteen sources contained in lead "cannon." He is able with its help to obtain a relative depth intensity greater than unity. Unfortunately so great a number of sources necessitates great obliquity of some of them; some valuable intensity is thus lost, and at the same time separate adjustment of each to cover the cancer is necessitated.

It is possible to obtain some crossfire by the use, instead of a point source, of a large flat one parallel to the skin. This system shows to the greatest advantage when the area is large compared with the skin-radium distance. It cannot, however, give such a high value of relative depth intensity as the screened point sources, since rays from it can reach the skin which do not pass through the lesion. Régaud of Paris employs a modification of this system. His radium is distributed in many tubes in the upper angles of a lead box having the side opposite the radium open. By this means he obtains a beam which is restricted approximately to the direction required. It is very large in cross section, but he believes that the intensity at a depth is increased by reason of secondaries generated in the surrounding tissues. The relative depth intensity obtained for a depth of 10 cm. is better than 25 per cent.

Cheval of Brussels employs a working skin-radium distance of 16 cm., at which distance his radium may be looked upon as a point source. He obtains some economy of radium by treating two patients simultaneously. Both Régaud and Cheval employ several "ports of entry," which is to say that the "beam" is directed at the cancer in several positions in such a way that from each position a separate area of skin is irradiated. In this way any given area of skin receives a correspondingly smaller dose. The relation between the depth dose and the skin dose is known as the "relative depth dose," and it has been found that a relative depth dose of unity is satisfactory for a depth of 10 cm. To obtain this value Régaud and Cheval must use four ports of entry. Sluys does not employ several sets of ports of entry, for he obtains a relative depth dose greater than unity with the one set.

In order to compare the economy of radium, it has been assumed that the most efficient method is that which produces at a depth of 10 cm. the greatest intensity. This occurs when the radium is placed on the skin in the position nearest to the lesion. The "relative efficiency" is the relation between the intensity actually produced at the depth and that produced as above by the same quantity of radium. Thus the relative efficiency of Cheval is 15 per cent.—this can, in a sense, be said to be 30 per cent. when he treats two patients—of Régaud 25 per cent., and of

Sluys 28 per cent., the skin-radium distances being respectively 16 cm., 10 cm., and 8 cm.

To measure the intensities obtainable by various "bombs" these intensities may be compared with the "standard needle intensity." Thus the "relative needle intensity" obtained by Sluys using one and one-third grams of radium is 46 per cent., that of Régaud using 4 grams 125 per cent., and that of Cheval using 4 grams 84 per cent.; or if each uses 1 gram they are, in order, 35, 31, and 21 per cent. Evidently, therefore, a carefully designed "bomb" can show considerable advantages on the score of economy. None of the "bombs" mentioned provide adequately for reducing the irradiation of the patient to a minimum—in the cases of Régaud and Cheval because the "beams" are not adjustable and therefore necessarily large, and in the case of Sluys because the source is so widespread that ports of entry cannot conveniently be chosen at will. It is only a matter of design to eliminate these defects.

In addition to giving (*a*) an intensity at a depth of 10 cm. of at least half the "standard needle intensity," (*b*) a relative depth intensity as high as 25 per cent., (*c*) a relative depth dose not less than 100 per cent., (*d*) a filtration of not less than the equivalent of 1 mm. of platinum, (*e*) control of the size of the "beam," a bomb must provide protection of the workers from the rays and a reasonable degree of comfort for the patient. It must also, for hospital purposes at least, be simple to operate.

Protection is usually provided in the form of lead screening round the radium, but during treatment there is always a proportion of the radiation unscreened, and the only really satisfactory protection from this is distance. While the bomb is being adjusted to the patient the radium can be entirely surrounded by lead, and probably no useful purpose is served by increasing the thickness beyond three inches. Régaud does not provide for complete protection by lead during adjustment, but the radium can be simply removed to a distance if desired. Cheval, on the other hand, has his radium so disposed that it can at will be completely surrounded by lead by the movement of a lever. Sluys provides only a very meagre protection, for the reason that he could not conveniently adjust his many "cannon" were they adequately protected.

Comfort for the patients is provided for by these workers by treating them while lying in bed or on comfortable stretchers. Cheval can place his patient either over or under his radium, which avoids the necessity of lying on the stomach, but the immobility of his "bomb" must necessitate rather difficult positions.

Details of the Westminster Hospital Temporary "Bomb."

The apparatus (Fig. 1) was constructed with the object of forming a definite opinion of the relative importance of the various factors already considered, as well as to employ usefully the radium which was originally supplied in the form of ten brass containers 6 cm. in length and 6 mm. in diameter, containing in all just over 1 gram.

No attempt was made to design a perfect "bomb," but merely to construct at a minimum expense and in the shortest possible time a means of applying the radium to the patient.

With reference to the diagrams (Fig. 2), a lead box L, some 3 inches in thickness, contains the radium tubes N, spread over its inner upper face. They are held in place by an aluminium plate O, one-eighth of an inch in thickness. The box has passing through it a steel shaft M, which bears, on the upper beam A, G of the steel trestle D, so that it can revolve about its axis. The beam itself can revolve about an axis at right angles to the latter, bearing at F. The trestle is provided with cross bracing K. The patient lies on a steel-framed stretcher C, which can be tilted at B, about its longitudinal axis. It can also be raised by means of the nuts and threads E; ball thrust races greatly reduce the effort required. The entire structure can, of course, be moved in almost any direction in a horizontal plane. The opening of the bomb, which is about 3 inches by 4 inches, is covered by wax P, half an inch in thickness, to absorb secondary beta particles. The total screenage amounts to just over the equivalent of 1 mm. of platinum.

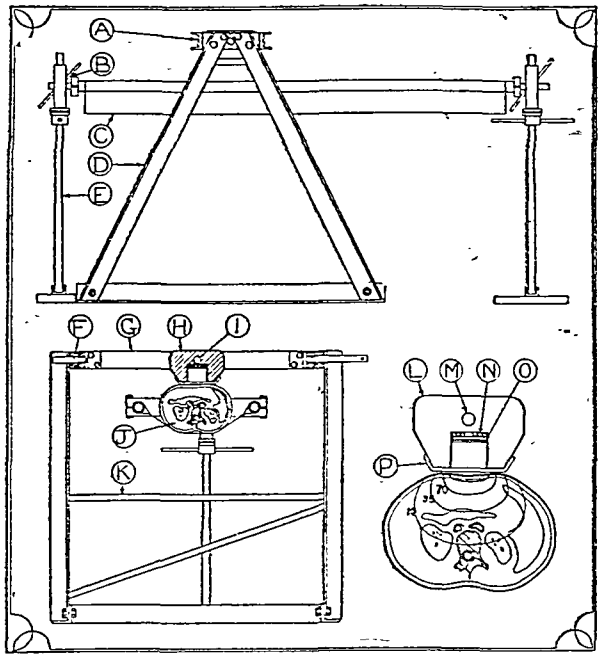

FIG. 2.

Apart from the obvious difficult of getting the patient into position with an arrangement of this kind, it has been found that patients resent more than anything else lying on the stomach and, indeed, are often quite incapable of doing so. Again, a patient cannot remain in one position for more than about two hours at a time twice a day. In this case the total time of treatment (with a gram) might well be two months.

It has been found that even after the patient is in position some considerable time is occupied in adjusting the "bomb" to the patient, even when, as is here the case, the beam is very large. It is likely, therefore, that when there is provision for reducing the size of the beam to a minimum for any given case the exposure of the worker would be excessive unless satisfactory means be adopted to prevent it.

The procedure in the treatment of a patient is the following. Transparent sections of the patient near the position of the lesion are prepared life size, from an atlas, the outline being modified by observation to suit the individual case. An iso-intensity chart of the gamma ray field from the "bomb" is then placed beneath the section so as to cover the estimated position of the growth. It is then possible at a glance to know the relative needle intensity at any point within the irradiated volume. At the same time the best ports of entry can be determined by observation. Not only can the required dose be estimated if the necessary clinical experience is available, but the patient's chance of recovery can be more than guessed at. It is largely with the help of these charts that the necessary value of intensity, relative depth intensity, and relative depth dose have been arrived at.

Experience with the temporary bomb has shown that with 1 gram of radium it will be necessary to work with the radium at a distance not greater than 6 cm. from the skin if the necessary intensities are to be obtained. It is also proposed, in the interests of economy, to treat two patients

simultaneously. In the design for the permanent bomb four point sources are placed approximately at the corners of a square, the radiation from each being restricted to a cone of any desired shape by means of lead screens, each cone, of course, employing a separate area of skin at entry, but all covering the depth point; the distance from the source to the skin is normally 6 cm., but can be increased to any desired extent, and also, if found desirable, reduced to 4 cm. The normal "relative depth intensity" at a depth of 10 cm. being 25 per cent., no difficulty would be experienced in using four ports of entry for the "beam," thus making the relative depth dose 100 per cent. The "relative needle intensity" would then be, at a 10 cm. depth, one-half the standard needle intensity. Radiation will be permitted on both sides of the square referred to, one patient being treated by each beam. The normal axis of the beams will be at about 45 degrees to the ground, and each beam separately adjustable in shape and size with separate screens. The patients will be parallel to one another on different levels, this arrangement permitting a greater latitude of adjustment between one patient and bomb without interfering materially with the adjustment of the other patient. It has been said that adjustment requires some considerable time, so that when two patients are treated the adjustment of one would interfere with the treatment of the other were adequate protection provided for the worker during this adjustment. It is proposed, therefore, to make the necessary adjustments with a dummy "bomb" symmetrically situated with respect to the one containing radium. It will then be possible to perform the adjustment at leisure without fear of harm from the radium, and yet to continue the treatment of the patient already in position. The adjustment effected, the patient will be transferred mechanically from the dummy to the real "bomb," and the necessity for the worker to approach it, except in cases of emergency, will be avoided.

Designs for the permanent "bomb" have been prepared, and will be published in due course.

EARLY GRAVES'S DISEASE.

BY

JOHN H. HANNAN, M.A., M.D., B.CHIR.CANTAB.,

REGISTRAR AND PATHOLOGIST, HOSPITAL FOR WOMEN, SOHO SQUARE.

THE cause of Graves's disease has yet to be found, but there can be small doubt that a connexion exists between the condition of the nervous system and the severity of the symptoms associated with this disease. In many instances a history of sudden shock or a period of prolonged emotional strain can be traced in the period before the onset of the disease.

In recording a case recently under my care I have two objects in view—namely, to lay stress upon the difficulties associated with the diagnosis of early cases, and, secondly, to show that by controlling the nervous symptoms of the syndrome a complete cure may occur, in some instances, without any other treatment. The following is an abstract from my notes of the case, which commence on February 1st, 1928.

A blonde woman, aged 21, consulted me complaining of loss of weight, which had been steadily increasing for some six months, associated with profuseness of menstruation, which had been hitherto regular in nature. In the past few weeks she had felt easily fatigued after the slightest exertion. Constant hunger was complained of, but attacks of diarrhœa and vomiting prevented her from indulging her craving for food. In the past fortnight she had had two attacks of fainting, in which she was unconscious for some hours.

On talking over the history with her father, I ascertained that two colleagues had diagnosed her condition as being due to early tuberculosis, and based their diagnosis on a history of night sweats and the progressive loss of weight. On examination I found that she was markedly emaciated; the skin was moist—in fact, she was perspiring freely, a phenomenon which, she said, occurred with distressing frequency. The pulse was feeble, and the rate varied between 120 and 140 beats per minute at different periods during the examination.

A thorough general examination was made, particular attention being paid to the condition of the lungs and the pelvic organs, with, however, negative results. On careful cross-examination I ascertained that the hot sweats occurred during the day as well as during the night. It became obvious during the examination that the girl's nervous system was profoundly disturbed, and that she was extremely restless; a fine tremor of the hand was constantly present.

Bearing in mind the clear syndrome presented by the foregoing symptoms, I made a provisional diagnosis of Graves's disease, and proceeded to look for the classical signs of this disease. The thyroid gland was found to be but slightly enlarged, not more so than commonly occurs in young women. Exophthalmos was absent; von Graefe's sign was not present. Stellwag's sign (widening of the palpebral fissure caused by a spasmodic retraction of the upper eyelids) was, however, present. Gootsch's test (reaction of the pulse rate and blood pressure to subcutaneous injections of adrenaline) was applied, and found to be positive. The urine was normal. The patient's weight was 7 st. 10 oz.

Finally, the patient was closely questioned, and I ascertained that she was greatly worried over her occupation as a typist, and that the symptoms of which she complained had come on shortly after obtaining employment in this capacity. A basal metabolism estimation was suggested to the father, but consent for this was not given owing to the extreme state of nervous exhaustion which my examination had produced.

I have, for some time, been engaged in investigating the syndrome of the menopause, and I have shown elsewhere that the change of life is associated with many symptoms which are present also in Graves's disease. In particular, I have shown[1 2 3] that women at the menopause have an increased sensitiveness to adrenaline injections similar to that exhibited by cases of Graves's disease in general and the case under consideration, this adrenaline sensitiveness forming the basis of Gootsch's test for early exophthalmic goitre. Furthermore, I have also published evidence[4] that the disturbance of the nervous system in women at the menopause is readily controlled by small doses of sodium veronal. I therefore prescribed a simple mixture, in this case consisting of sweetened water (to disguise the bitter taste of the sodium veronal) and sodium veronal, in such a dosage that the patient would take 1 grain of sodium veronal three times daily in a tablespoonful of the mixture. She was then instructed to report weekly.

The progress of the case was dramatic. On August 28th, 1928 (some seven months after commencing treatment), her weight had risen to 10½ st., all her symptoms, including the menorrhagia, had disappeared, and her pulse rate was now 65 beats per minute and of good tension. At the present time she is entirely normal and back at work.

It is interesting to note that some four weeks after seeing me for the first time exophthalmos became obvious and von Graefe's sign was positive. After this time, the exophthalmos became quickly better and von Graefe's sign disappeared. Stellwag's sign, which was the first to appear, was the last to disappear—namely, at four months after commencing treatment.

Several points of interest arise on considering this case. In the first place, we have the confusion which arose between the diagnosis of early tuberculosis and early Graves's disease without exophthalmos and without marked enlargement of the thyroid. In particular, I would draw attention to the importance of Stellwag's sign in these cases, which others, besides myself, have found to be present before exophthalmos becomes a feature of the syndrome. Furthermore, I would suggest that Gootsch's test might be more frequently employed with advantage in cases of this nature.

With regard to treatment, I feel that more attention should be given to the control of the nervous symptoms associated with Graves's disease than is done at present, and suggest that all patients showing evidence of this syndrome should be given a course of sedative treatment with sodium veronal before more drastic measures are undertaken.

THORACOSCOPY AND CAUTERIZATION.

BY

IN 1910, for the first time, Jacobaeus divided pleural adhesions by the galvanic cautery under the guidance of endoscopy. The results attained by earlier workers were far from encouraging, and even the procedure of Jacobaeus is not free from objection. That his operation is justified is clear from the results it has achieved; we criticize it, however, on the ground that after the pleural adhesions have been severed the incidence of tuberculous empyema, even of mixed bacterial infections, is very high. According to Jacobaeus and others who have used his operation, 10 per cent. of cases are followed by mixed bacterial empyema and 36 per cent. by tuberculous exudates, of which 15 per cent. are serious. Kremer and others have recently published statistics showing a somewhat smaller proportion of such infections of the pleural cavity. On the other hand, when there are no complications, improvement is obtained by means of this operation—according to Jacobaeus in 66 per cent. of cases, and according to Kremer in 63 per cent.

Recently one of us (G. M.) has elaborated a method of dividing pleural adhesions, especially those of considerable size, by means of a combination of the galvanic cautery with a prophylactic coagulation by diathermy. In this writer's series of cases only 1 per cent. with mixed bacterial empyema and 4 per cent. with serious tuberculous exudates have been observed; this represents a substantial reduction in the incidence of a dangerous complication.

The prophylactic diathermy is valuable for the following reasons. After the induction of artificial pneumothorax in cases of pulmonary tuberculosis the pleural surfaces are separated, adhesions between them being drawn out into the form of bands, which may consist either of lung tissue or of fibrous tissue, or, as is usually the case with adhesions of any size, of both. It is necessary to sever each adhesion as closely as possible to its parietal end and thus to prevent damaging the bronchial system and the lung tissue, and opening up the walls of cavities which may have been drawn into the adhesion. This procedure, which requires a considerable amount of technical skill, may be rendered very difficult by the rich supply of vessels usually found in the parietal portion of the adhesion, and, through the thoracoscope, seen clearly passing from the parietes into the adhesion. The danger of haemorrhage can, however, be almost completely eliminated by thoroughly coagulating the thoracic part of the adhesion with the diathermic cautery before severing it by means of the galvanic cautery. Attempts have been made to break down adhesions by the diathermic cautery alone; it has been found, however, that a current which is powerful enough to sever adhesions is likely also to produce dangerous internal reactions; indeed, in cases where the stumps are rather short the resulting necrosis may even reach the lung parenchyma, and eventually lead to the dreaded complication of empyema. We believe that diathermy used only to secure coagulation of vascular adhesions is a valuable procedure which lowers the incidence of complications and opens the way to still further development of Jacobaeus's original operation. The following case may serve to demonstrate the possibility of this combined method.

The patient, a man aged 24, suffering from severe tuberculosis, had a daily rise of temperature up to 102° F., and brought up each day about 2 oz. of muco-purulent sputum containing tubercle bacilli and elastic fibres in large quantities. The following radiographic appearances were observed after the induction of artificial pneumothorax on the left side. *Right side*: a light veiling was seen in the upper part, and in the lower part there were numerous small soft shadows. *Left side*: the apex was diffusely clouded, the lung being apparently firmly fixed by adhesions.

Five months after the induction of pneumothorax an attempt was made to divide the adhesions on the left side by the combined method above described. Through the thoracoscope the pleural cavity was seen to be strongly vascular, the intercostal spaces and rib demarcation being clearly visible. The apex of the lung was fixed chiefly in the neighbourhood of the second rib by an adhesion about the thickness of a little finger. A thin transparent band was seen stretching to the front of the chest, and two others, each about the thickness of a lead pencil, stretched upwards and forwards from the lung to the chest wall. The patient stood the operation very well, having practically no reaction. His temperature gradually settled down, becoming normal a week later, and he showed great improvement in general health. Three months later the cough and sputum had disappeared and a radiograph showed healing of the lesions on the right side and total collapse on the left side.

In this case, considering the technical difficulties involved in breaking down the coarse adhesions, complete thoracoplasty might have appeared to be the operation of choice; on account of the bilateral disease, however, and of the poor general condition of the patient, the plastic operation was ruled out, and the ultimate result in this case has proved to be very good.

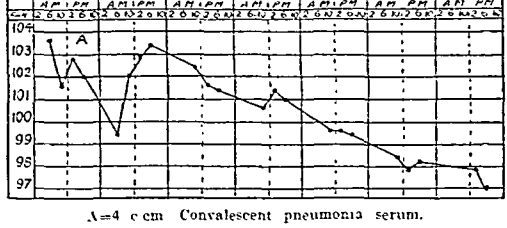
MEDICAL, SURGICAL, OBSTETRICAL.

TREATMENT OF PNEUMONIA BY CONVALESCENT SERUM.

THE following description of a case of influenzal pneumonia treated with convalescent serum is given in the hope that it may stimulate the application of similar treatment to further cases and so enable conclusions to be drawn as to the value of the procedure.

During the week ending February 2nd, a female patient, aged 34, had a sharp attack of influenza. After the temperature had been normal for a day it rose rapidly again with the development of central influenzal pneumonia. The sputum was rusty and blood-stained, signs were indefinite but suggestive of mainly left lower lobe involvement. Throughout the attack pleurisy was absent, and possibly on this account the respiration rate was little affected. At the end of the seventh day a rapid lysis set in and the temperature dropped to normal in thirty-six hours, with the usual amelioration of symptoms (February 11th).

While the patient's temperature was falling (February 10th) her child, a boy, aged a year and eleven months, became ill, and in two days (February 12th) he was obviously suffering from pneumonia. On February 13th, at 6 p.m., two days after his mother's temperature had reached normal, he was given 4 c.cm.



A=4 c.cm. Convalescent pneumonia serum.

of her serum subcutaneously, the blood having been taken four hours previously. He had been delirious during the day, and for three or four hours after receiving the dose of serum he had attacks of wild delirium separated by periods of disturbed sleep. About 11 p.m. he became quiet and slept for the rest of the night. In the morning his temperature was 99.4° F., a drop of nearly three degrees, his condition seemed much less toxic, and he began to take fluids with avidity. Though his temperature rose to 103.4° the same evening, it began to drop from that point about a degree every day, reaching normal on February 18th. The respiration rate remained 50-60 till the temperature had reached normal, but the general condition never caused as much anxiety as it did before serum was given.

No bacteriological examinations of sputum were made, but it was concluded from the type of temperature in the case of the mother, and the absence of any tendency for it to recur after the rapid lysis, that infection was mainly pneumococcal.

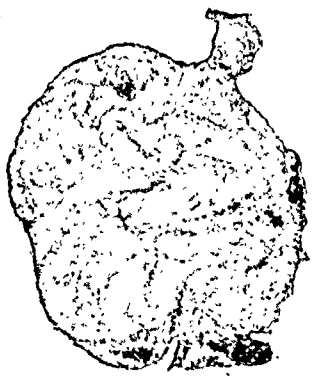
FIBROMA OF THE URINARY BLADDER.

A FIBROMA of the urinary bladder is such a rarity that it seems advisable to place the notes of such a case on record.

The patient, a married woman of 28, was admitted to the Royal Waterloo Hospital, under my care, complaining of (1) acute pain before and during micturition (duration of symptoms eleven months); (2) partial loss of bladder control (duration five months). The first symptoms noticed (about one year before her admission into hospital) were suprapubic colicky pains and frequency of micturition. The latter, which at first was intermittent, had become progressively severe. The frequency of micturition, which was accompanied by pain, increased from eight to twenty times a day, and from three to six or eight times at night. During the last five months there was partial loss of bladder control. There was no history of haematuria, rigors, or pains in the region of the kidneys. She had little or no sleep, and she was rapidly losing weight. The patient had had no children, no miscarriages, and menstruation was normal in every way. There was no history of gonorrhoea or syphilis, or of any serious previous illness.



The patient was a thin, pale, nervous woman, and examination showed that the heart, lungs, and nervous system were normal. The kidneys were not tender or palpable. There was no evidence of distension with overflow. Three ounces of urine were withdrawn for a catheter specimen examination, and this showed no abnormal constituent apart from a slight excess of mucus. A rectal examination was negative; and per vaginam the uterus was felt to be anteflexed, and of the usual size and shape. On bimanual examination a circular tumour, about the size of a golf ball, could be felt in the bladder and separate from the uterus. On cystoscopy the tumour was seen to be covered with healthy mucous membrane, and to be lying three-quarters of an inch above the right ureteric orifice in the right antero-lateral wall of the bladder. Bilateral ureteric catheterization proved the kidneys to be healthy. A cystogram was taken, but this did not show any gross "filling defect."

Operation.—Under a general anaesthetic the bladder was distended with 8 oz. of warm boric lotion, and the patient was placed in the Trendelenburg position. An extraperitoneal exposure of the bladder was obtained through a suprapubic incision, and the viscus opened in the middle line. On retracting the walls of the bladder a hard submucous tumour was found on the right antero-lateral wall. The mucous membrane over it was incised and the whole tumour was shelled out of its bed. The rent in the mucous membrane was closed with 00 non-chromicized catgut suture, and the bladder was drained through a small suprapubic tube.

Description of Tumour.—The tumour was white, encapsuled, almost circular, hard, elastic, and presented all the naked-eye appearances of a fibroma. The surface was thrown into irregular folds, and, on section, whorls of fibrous strands could be seen.

The microscopical report of the sections showed the tumour to be a "puro" fibroma. Weight: 320 grains. Size: maximum diameter 5 cm., minimum diameter 4 cm., maximum circumference 11 cm., minimum circumference 9½ cm.

The patient made a good recovery; she passed urine per urethram on the fifth day; was allowed out of bed on the ninth day; and the wound was healed on the seventeenth day after the operation.

On discharge she had complete control of the bladder, and there was no pain or frequency of micturition. Cystoscopy performed two months later showed the bladder to be normal. She was then rapidly putting on weight, and looking fit and well.

RODNEY MAINGOT, F.R.C.S.,
Surgeon, Royal Waterloo Hospital.

PREGNANCY FOLLOWING AMPUTATION OF THE CERVIX.

THIS interesting condition occurred in a multipara, aged 34, who gave the following history.

She had had an amputation of the cervix performed eighteen months previously and followed by regular but painful menstrual periods. In July, 1928, she became pregnant, and nothing untoward occurred until February 16th, 1929; she was then seven months pregnant, and her membranes were said to have ruptured. Drainage of liquor continued during the following week, but she did not complain of pains until 1 a.m. on February 22nd. The pains continued, and she was admitted to hospital at 12.50 a.m. on February 23rd, because she was making no progress, and no dilatation could be felt by her doctor.

Abdominal examination on admission indicated a vertex presentation; the head was well engaged, and foetal heart sounds were easily heard. On vaginal examination, much to one's surprise, no os could be found. There was much scar tissue, which was very friable, the patient bleeding easily; the head was well down, and the lower uterine segment was thin and bulging. The only obvious spontaneous termination seemed to be rupture of the uterus by the head pushing its way through the lower uterine segment. Caesarean section was therefore performed and a living child of 5 lb. weight was delivered. A tube was passed through the lower uterine segment into the vagina to drain the lochia. The patient was pyrexial for about three weeks following delivery, after which she made an uninterrupted recovery.

This case is interesting in that menstruation had occurred regularly and liquor amnii had drained away in spite of the fact that the scar tissue had seemingly obliterated the external os.

Reports of Societies.

RADIUM TREATMENT OF UTERINE CANCER.

AN open meeting of the London Association of the Medical Women's Federation was held at the British Medical Association House, Tavistock Square, on May 4th, when a report of the Cancer Research Committee of the London Association on three years' work on the treatment of uterine cancer with radium was presented.

Dr. FRANCES HUXLEY, from the chair, reminded the gathering that the Cancer Research Committee was formed in 1924, although it did not begin clinical work until late in the following year. More than three years' experience had now been gained as to the application of radium in cancer of the uterus. The report to be presented was really a continuation of one which was made rather more than a year ago (*British Medical Journal*, April 14th, 1928, p. 641), but the committee now had further encouraging results to communicate, and was looking forward to fresh developments.

Miss M. CHADBURN said that the work on cancer of the uterus treated by radium took place between October, 1925, and March, 1929. The committee first spent a considerable time in the general study of radium treatment, especially as carried out in Continental clinics, in deciding upon the technique and in designing the applicators, and in collecting the necessary funds to obtain the loan of the radium. The actual clinical work had been carried on up to the present in four hospitals—namely the South London Hospital for Women, the Elizabeth Garrett Anderson Hospital, the New Sussex Hospital for Women and Children at Brighton, and the Royal Free Hospital. The actual number of clinicians working in co-operation was eighteen. Each hospital was allocated its day for the use of the radium available, the radium being conveyed to and from the hospital by an officer appointed for the purpose. All the eighteen clinicians had been using the same technique and the same recording and follow-up systems. The work, although scattered over four centres, had been co-ordinated, because, in the first place, the technique was settled by the committee, which included representatives from each hospital, and by the clinical subcommittee, which included all the medical women engaged in the research; and, in the second place, the whole work was supervised by one research officer, a senior member of the profession and an experienced gynaecologist, Dr. Hurdon, who had given her whole time to the work of superintending the radium applications at the different centres. At first most of those concerned agreed to treat inoperable cases only. The surgeons at that time had more faith in operation than in radium, but subsequently more and more operable or borderline cases had been treated. Those concerned were now unanimous in feeling that the work could most advantageously be centralized in one hospital. The result was that the Marie Curie Hospital (named after the discoverer of radium), at Swiss Cottage, was expected to be opened in September of this year. Here it would be possible to work without the disadvantage of a scattering of centres, and the work might be widened beyond treatment of the uterus. Unfortunately, the hospital would have to make its own way financially; there would be private wards, but an appeal must be made to a generous public.

Dr. HURDON then gave a description of the cases treated, and some eight or ten of the patients, three of whom had come from Brighton, were presented to the audience as living witnesses to the efficacy of the treatment. These had been mostly cases of squamous carcinoma of the cervix, the symptoms having lasted for several months. The period which had elapsed since treatment was in only one case less than three years. A few of the women were above 60, but the average age would be from 45 to 50. Their

condition when treatment began was described as operable or borderline. Dr. Hurdon showed some tables giving the total cases treated since 1925. By far the greater number —191—were cases of cancer of the cervix; of these, 130 were still living. Operable or borderline cases accounted for about 21 per cent. of the whole. Recurrences were found to be very much more frequent during the first year following treatment; in subsequent years these diminished, and in the fourth and fifth years were very few. She thought the value of radium treatment had been definitely demonstrated. It had to be remembered, of course, that many of the patients applying were already in a very advanced condition.

Miss HELEN CHAMBERS gave a description of the technique employed. She said that it was based upon Heyman's technique at Stockholm, modified by the results of experimental work done in this country, especially in the laboratories of the Middlesex Hospital under Professor Sidney Russ, to whom those concerned in this research were greatly indebted. She showed slides illustrating the disposition of the radium tubes. Usually two tubes were placed, tandem-wise, in the intrauterine position, and two or three applicators in the vaginal vault. She reminded the meeting that, satisfactory as many of the results appeared to be, it was still possible only to cure—in the sense of a period of years free from symptoms—twenty out of a hundred patients applying; so that there was a great deal of room for improvement and for the devising of supplementary methods of treatment, notably x rays.

Dame LOUISE MCILROY emphasized the value of this joint work by the association. Three years ago some medical women from this country went over to Paris and saw Régaud's clinic, where they were so impressed by the work done with radium that they—she at any rate—gave up operating for carcinoma of the cervix in favour of radium therapy. She had also applied radium treatment in carcinoma of the body of the uterus with good results. The success of radium in this field was not to be doubted, and it was possible that in the future, with improved technique and better facilities, carcinoma of the breast might be dealt with similarly. Lately at the clinic in Brussels she with others had been impressed by the treatment of cancer of the rectum. But although this work undertaken by the London Association had produced satisfactory results beyond expectation, she thought it was a wise policy not to rush into print about it or to make very much of it for the present, waiting at least until the end of a five-year period. One eminently satisfactory feature with radium was the absence of operative mortality, which had the indirect value that it made women more likely to come early for advice when they knew that they had not the risk of operation hanging over their heads.

Miss ELIZABETH BOLTON forwarded some notes on cases from the Elizabeth Garrett Anderson Hospital. The number of cases of cancer of the cervix treated during three and a half years was 48, and 31 remained alive. Practically all were inoperable, though a few might be described as borderline. Advanced cases treated during 1925 were still living.

Miss LOUISA MARTINDALE said that this report was forthcoming evidently at the psychological moment when there was a movement all over the country for greater supplies of radium. More knowledge was necessary with regard to supplementary methods, especially intensive x-ray therapy. She had lately returned from a tour of Continental clinics —Frankfort, Freiburg, Geneva—and everywhere she had found that the practice of operating on the cervix was being given up in favour of radiation methods. She had been particularly struck at Frankfort by the provision for intensive x-ray therapy.

Dr. MALCOLM DONALDSON congratulated the London Association very heartily on the magnificent work it was doing, and especially on the team spirit displayed. He deplored the fact that at St. Bartholomew's, while they had the team, they lacked the beds. Lady BARRETT and others added their congratulations, and Dr. HELEN CHAMBERS, in reply, after acknowledging the willing co-operation of the surgeons, remarked that, after all, medical women, in taking up this field of endeavour, were only performing a simple duty to their sex.

INDICATIONS FOR SPLENECTOMY.

AT a joint meeting of the Sections of Surgery and Medicine of the Royal Society of Medicine, on May 1st, with the president of the Section of Surgery, Sir HOLBERT J. WARING, in the chair, a discussion was held on the indications for, and the results of, splenectomy.

Dr. HUGH THURSFIELD, opening for the Section of Medicine, reminded the meeting that seventeen years previously he had opened a similar discussion at a time when the operation appeared to be a daring innovation. The advance of surgical technique and of the experimental side of surgery had since that time led to a considerable increase in the knowledge of what could be done by splenectomy, but exact knowledge of the functions of the spleen remained almost the same as it was thirty years ago. It was known that the spleen was somehow concerned with the processes of digestion, and also with acute infective processes; but there was no other statement about the functions of the spleen which had not been challenged. It had been established that the spleen as an organ did not represent all the splenic tissue in the body, and hence splenectomy could not remove all splenic tissue. It was also known that removal of the spleen for any sort of condition produced no permanent changes which could be constantly identified; there was no permanent effect on blood formation, and the platelets, although raised at first, if low before operation, were soon at the old level. Dr. Thursfield said that splenectomy was a modern operation, the first recorded example having been performed by Spencer Wells in 1866; the patient was still living. There were three medical conditions for which splenectomy was advised almost as a routine: the first of these was splenic anaemia, which was defined as a chronic disorder with primitive splenomegaly, reduction in the red cells without the appearance of nucleated forms, a low colour index, leucopenia without myelocytes, and a diminished or normal fragility of the red blood corpuscles. Dr. Thursfield thought that the term Banti's disease ought not to be employed, since it was doubtful whether the condition occurred outside Florence. It was agreed that removal of the spleen was indicated for splenic anaemia as soon as possible after diagnosis, and by this means it was possible to restore a chronic invalid to a useful life. The second condition in which splenectomy gave brilliant results was congenital acholuric jaundice, in which it resulted in a cure, and the fragility of the red cells became normal. The third condition was the thrombocytopenic type of purpura haemorrhagica, in which it was believed that the blood platelets were restored to their normal quantities; although recent work had shown that this increase in the platelets was only temporary, the operation certainly stopped the haemorrhages. It was beginning to be held that the platelets played no part in the occurrence of the bleeding, but in any case splenectomy produced cure in about 80 per cent. of the chronic cases. Apart from these three conditions opinion was not so unanimous. In acquired cases of acholuric jaundice the operation of splenectomy by itself was not so effective as in the congenital cases, and any focus of sepsis must be carefully looked for and eliminated. The fragility of the corpuscles in these cases was not necessarily affected by the operation. Other conditions for which splenectomy had been performed included pernicious anaemia, a procedure now rendered unnecessary by the liver treatment, and cirrhosis of the liver. There were many forms of this condition, some of them cryptogenetic; it was known that removal of the spleen had a great effect on the liver in such conditions as splenic anaemia, where a cirrhotic process might be brought to a standstill. Hence, in every case of cirrhosis of the liver the question of splenectomy ought to be considered. At the Mayo Clinic 35 patients with cirrhosis of the liver had had their spleens removed, and of this number ten were alive and nine in good health. It appeared probable that in splenectomy there was a new weapon for combating cirrhosis of the liver, although it could not be used for advanced cases with ascites. Lastly, Dr. Thursfield mentioned the use of splenectomy for Egyptian splenomegaly, and for certain cases of myelocytic leukaemia.

Mr. A. J. WALTON, for the Section of Surgery, said that the surgical problems connected with splenectomy were difficult; it was first of all essential to have some sort of

classification upon which to work. It was also difficult for the individual surgeon to have great experience of all the conditions for which the spleen might be removed. Mr. Walton began with injuries of the spleen, including spontaneous and traumatic rupture; in this country the latter was the more common, and it was noticeable that the amount of trauma might be very slight. Torsion of the spleen also occurred, but was seldom diagnosed. Local lesions of the spleen included cysts and tumours. Hydatid cysts were most common in those countries where this infection was frequent, but in this country dermoids and other neoplastic cysts were commoner. Of tumours of the spleen fibrosarcomata were the commonest, producing large painful growths. There were also tumours due to overgrowth of the lymphoid elements, some of which it was difficult to distinguish from Hodgkin's disease. In the speaker's experience, if the lymphatic glands in the abdomen were found to be enlarged during the splenectomy the outlook was poor. The inflammatory lesions of the spleen were acute or chronic. A localized abscess was important surgically, producing a tumour with pain and pyrexia; if seen early, splenectomy was possible. In the later cases drainage and marsupialization were necessary. Chronic cases were more difficult, for one found patients with large spleens and all the symptoms of splenic anaemia. These cases had usually a pyogenic focus, which had to be cleared up. Mr. Walton included splenic anaemia in this group of chronic inflammations, and he regarded this condition as an early stage of Banti's disease. The results of splenectomy before liver changes had occurred were good, and there was some evidence that the liver might improve after operation if it was already affected. He did not think there was much evidence at present to support splenectomy as a therapeutic measure in cases of cirrhosis of the liver. The operation was not indicated in Hodgkin's disease; in such diffuse disorders as malaria, tuberculosis, and syphilis splenectomy might be called for in exceptional cases. In cases of secondary polycythaemia with much enlargement of the spleen its removal was of some value. In the next group of general blood diseases Mr. Walton placed first aplastic anaemia, for which splenectomy was not advised. With regard to pernicious anaemia, he discussed the possibility of cases of secondary anaemia due to bleeding gastro-jejunal ulcers passing into the pernicious type, especially if gastrectomy had to be performed. In cases of haemolytic jaundice splenectomy was not always necessary if the patients were not seriously troubled by the malady. With regard to purpura haemorrhagica, it was not a sound rule to remove the spleen because the platelets were decreased. It was much more important to consider the problem of whether the removal of the spleen would be dangerous if the platelets were normal, because of the risk of thrombosis. Splenectomy in Gaucher's disease should only be undertaken to relieve symptoms; it could not cure the disease. In cases of leukaemia the results did not appear to justify the operation. Discussing the general considerations with regard to splenectomy, Mr. Walton said that a platelet count and a white cell count were important; the size of the spleen was also of some help, for the bigger it was the more evidence there usually was of its destructive activities. He used a double incision, a left pararectal, with an extension carried up obliquely in the line of the intercostal nerves; the first essential was to cut down to the vessels and ligature them.

Dr. A. F. HURST thought that purpura haemorrhagica was a misleading name, since all purpuras were haemorrhagic, and many cases of this disorder had no purpura. He preferred the term "haemorrhagic diathesis," which manifested itself by a tendency to bleed, mostly into the skin, but also from the stomach, bowel, uterus, kidneys, and nose. The first haemorrhages might occur from one of these sites, and not into the skin at all. In obscure cases of gastric haemorrhage it might be well to examine the blood; if the platelets were reduced or the bleeding time prolonged splenectomy should be considered. Essential haematuria might also prove to be the same sort of disorder, and some cases of uterine haemorrhage also came into this category. In late cases of splenic anaemia with cirrhosis of the liver and ascites the mortality after operation was higher, but Dr. Hurst still thought that splenectomy should be performed. He mentioned one case of syphilitic infection where no improvement occurred until the spleen was removed.

Dr. F. PARKES WEBER said he had never recommended splenectomy, although he had seen cases in which it had been performed, or might have been performed. He had recorded a family with inherited haemolytic jaundice in which the jaundiced members for the most part enjoyed good health. During the strain of the war one of the younger members became very ill, and the spleen was removed. The others still enjoyed good health, and Dr. Parkes Weber was uncertain as to what advice he ought to give. He had seen cases of purpura haemorrhagica in which splenectomy was contemplated, but in spite of this he was still uncertain when the operation should be performed and in what kind of case. With regard to the pathology of the spleen, he thought that in acholuric jaundice the spleen caused excessive destruction of abnormally fragile blood corpuscles; in purpura it destroyed or counteracted the abnormal thrombocytes. In both diseases there must be some other factor present, however, possibly connected with lipoid metabolism, and Dr. Parkes Weber urged that the blood cholesterol should be determined in all cases of splenomegaly. In Banti's disease he had seen a case come to necropsy with extensive thrombosis of the mesenteric and portal vessels, and he felt that splenectomy would have precipitated a fatal issue. He had seen one case of lymphatic leukaemia in which great benefit had been experienced from removal of a bulky spleen. In conclusion, Dr. Parkes Weber emphasized that an enlarged spleen might be serving a useful purpose.

Dr. A. KNYVETT GORDON remarked that in most medical conditions submitted to splenectomy the diagnosis had to be determined by clinical pathology. He had reached certain conclusions with regard to splenectomy, especially concerning its value in thrombocytopenic purpura. Whenever spontaneous bleeding occurred it was important to examine the spleen and the platelets. Any septic focus must also be investigated, and if an organism was found its pathogenicity must be tested. If the platelets were reduced then the spleen should be removed irrespective of its size or the site of the bleeding. Splenectomy should also be performed in cases of splenic anaemia in order to prevent the development of Banti's disease, but it should not be employed in any case with a leucocytosis.

Mr. R. E. KELLY said he had removed the spleen for almost all the classical conditions, and he had seen fragility of the splenic vessels in many cases at operation. He used as his incision one passing horizontally across the abdomen; this gave good access. He thought that it was not strictly true that patients with congenital acholuric jaundice were ever really well; during the bouts of illness from which they suffered the spleen often became larger. With regard to splenectomy and its effect on the platelet count, he showed charts illustrating how this count was increased after operation, but generally came down again, although in two cases the increased platelet count was maintained for a long time. There was a danger of thrombosis when the platelets were increased after operation. From observations on the blood in the splenic artery and vein it was ascertained that the spleen caught and held one platelet in every four taken to it.

Dr. P. MANSON-BAHR explained that Egyptian splenomegaly was part of a general infection; the enlargement of the spleen in these cases was not easy to understand, and was probably secondary to changes in the liver. The blood picture was like that of splenic anaemia, and while the parasites which caused the disease were killed off by antimony tartrate, it was also necessary to excise the spleen. It had been advanced that the removal of the spleen was simply a way of getting rid of redundant tissue in such cases, and was purely mechanical in its beneficial results.

Sir HOLBURT WARING thought that if adhesions were present these must be dealt with first before it became feasible to get at the splenic vessels in splenectomy.

Dr. THURSFIELD, replying, emphasized the connexion between enlargements of the spleen and cirrhosis of the liver as brought out in the discussion, especially in certain tropical conditions. He felt that splenectomy ought to be

a more common operation in such cases. Mr. WALTON, replying, mentioned that in many cases of congenital acholuric jaundice there were gall-stones as well. If pure pigment stones were found in a case of gall-stones the fragility of the red blood corpuscles ought to be investigated.

DIAGNOSTIC PROBLEMS.

AT a meeting of the Devon and Exeter Medico-Chirurgical Society at the Royal Devon and Exeter Hospital on April 25th, with Dr. F. A. ROPER in the chair, Dr. ROY CRAIG showed a girl, aged 17, with symptoms of early disseminated sclerosis.

Dr. Craig said that the prominent subjective symptoms in this case were giddiness and difficulty in walking. There was a slight degree of nystagmus, and the left disc showed some pallor and congestion. Tremor was noticeable in the right hand. The plantar reflex was extensor on the right side, and both patellar reflexes were greatly exaggerated. Ankle clonus and spasticity were absent on both sides. Dr. Craig remarked that the initial symptoms were compatible with a diagnosis of "hysteria," but these were followed by unsteadiness of gait and intention tremor, with much variation in their intensity from time to time. He concluded, therefore, that the evidence indicated the presence of a pyramidal lesion, where the pressure of the axon was not yet complete—a lesion which should not be regarded as beyond hope of cure. The pressure required treatment, but the variation in symptoms showed that there was as yet no actual destruction. Intramuscular injections of bismuth given in the intervals between intravenous injections of the arsenical compounds answered best in these cases. Treatment by malaria infection had proved of doubtful value in disseminated sclerosis.

Dr. ROPER said he had found disseminated sclerosis of rare incidence in the South-West; the majority of the cases occurred in young girls. The disease seemed to be more common in the industrial centres in the North of England. Dr. W. GORDON remarked that hysteria and disseminated sclerosis afforded an excellent example of the "coupled diagnosis"; neither of these conditions should be considered as being present without the possibility of the existence of the other being borne in mind.

Dr. CRAIG also showed to the meeting, for comparison, a boy, aged 8, who was a cretin under treatment, and a girl, aged 2¾, with Mongolism. As points in the differential diagnosis, Dr. Craig demonstrated the restlessness, the protruded tongue, the shuffling, the small head, and the groove in the palm of the hand—all very marked in this case of Mongolism. In the cretin shown to the meeting there were the typical facies with sunken bridge of the nose, the dry skin, lethargy, and the backward mental development, as opposed to the definite mental deficiency in the Mongol.

Dr. F. A. ROPER showed a girl, aged 16, known to be the subject of diabetes insipidus since the age of 4, when she was found to have an inordinate thirst. Up to the present time all treatment had failed to stem a polyuria ranging from 8 to 12 pints in the twenty-four hours. The girl was undersized, and menstruation had not yet appeared, although the onset of puberty was otherwise indicated. She had complained of severe headaches from the age of 15, and there had been two recent attacks of an epileptiform character. Beyond the very low specific gravity, relative to the polyuria, the urine showed no abnormality. Radiographs of the skull were negative as regards abnormality in the pituitary fossa. Dr. Roper had admitted the girl to hospital quite recently, and it was too early yet to estimate the value of pituitary injections, which were being given *pari passu* with routine investigation of the urine.

Dr. CROCKFORD cited the case of a middle-aged woman suffering from mammary carcinoma who suddenly developed symptoms of diabetes insipidus, doubtless from a secondary deposit in or near the pituitary body. Dr. W. GORDON mentioned the case of a woman, aged 50, where the alternative diagnosis of renal cirrhosis was negatived. Pituitary injections had been considered of diagnostic value at one time. As regards the pathology, one possibility was a basal meningitis of syphilitic origin.

Varieties of Aneurysm.

Dr. R. V. SOLLY showed pathological specimens of three recent cases of aneurysm.

The first was a saccular aneurysm of the ascending aorta from a man, aged 49, with pressure symptoms involving the left lung. The chief interest in this case arose from the fact that the man had carried on his work as a postman without apparent distress, and had not consulted a doctor for fifteen years. He collapsed suddenly when going up a hill, and became deeply cyanosed and unconscious. Subsequently he made a partial recovery, but pressure symptoms on the left lung remained constant until his death two months after admission to hospital.

In the second case there was a dissecting aneurysm of the abdominal aorta. A married woman, aged 49, was admitted to hospital complaining of vomiting after food, and of feeling a lump in the stomach. She was found to have an aortic diastolic bruit, and a pulsating abdominal tumour to the left of the umbilicus. The blood pressure was 242/120. The Wassermann reaction was negative. The necropsy revealed hypertrophy of the left ventricle, and atheromatous changes in the aorta and on the mitral aortic valves. There was also marked thickening of the abdominal aorta down to the common iliac bifurcation.

The third case was one of aneurysm of the descending thoracic aorta, which had burst into the left side of the thoracic cavity. A man, aged 46, was admitted to hospital for a suspected pleural effusion; he had complained of pain in the right side and under the right shoulder blade of twelve hours' duration. On examination he was found to have dullness at both pulmonary bases, left-sided cardiac enlargement, and a diastolic bruit in the aortic area. The pupils reacted poorly to light and the tendon reflexes were sluggish. The Wassermann reaction of the blood was positive. The man died suddenly twenty-four hours after admission, having shown no particularly urgent symptoms prior to the fatal collapse. The necropsy revealed an enormous clot, filling the left side of the chest. A sacculated aneurysm, the size of an orange, was found just above the diaphragm; it arose from the descending portion of the thoracic aorta. The site of rupture was on the anterior surface and was half an inch in breadth. Erosion of the ninth, tenth, and eleventh dorsal vertebrae had taken place, an aneurysmal sac being adherent to the spine at that level.

DIGITALIS IN THE TREATMENT OF AURICULAR FLUTTER.

A MEETING of the Section of Medicine of the Royal Academy of Medicine in Ireland was held on April 12th, with the president, Dr. R. J. ROWLETTE, in the chair. Dr. H. F. MOORE read a paper entitled "Some further experiences with auricular flutter," and illustrated the course of each case by electro-cardiograms.

Dr. Moore reported that sixteen attacks of established flutter had been seen in eight patients within the last six years; in one case only was the Wassermann reaction positive. In this case two attacks of flutter were successfully treated; the patient subsequently died with cerebro-spinal syphilis, but with an apparently normal heart rhythm. One patient died two hours after admission to hospital with 1.1 ventricular response—a very rare condition. Six patients were still alive. Fifteen out of sixteen attacks of flutter were abolished, with final restoration of the sinus rhythm by full digitalization (to induce auricular fibrillation), followed by three doses of quinidine (to induce normal rhythm).

The PRESIDENT thought a point to bear in mind was that digitalis might be pushed more than probably most clinicians had done up to the present. The failure of others to get results comparable with those of Dr. Moore was probably due to the fact that they did not do this.

Dr. G. E. NESBITT said that he had come across only two cases of flutter. He believed that in Dr. Moore's third case the patient had exhibited some signs of bundle-branch block. Myocarditis was undoubtedly present, and he regarded the prognosis as bad. He thought it was necessary to be very careful in increasing the dosage of digitalis; he had seen cases in which the patient had developed coupled rhythm subsequently. He mentioned a case of typical flutter in a man, aged 75, in whom the condition had been present for two years; after a holiday without treatment he came back with normal rhythm.

Dr. L. ABRAHAMSON referred to a case of auricular flutter with persistent 4.1 block. He pointed out that in paroxysmal flutter the administration of digitalis was unnecessary, since in cases where the attacks did not cease spontaneously quinidine alone usually sufficed to restore normal rhythm. He mentioned a case of paroxysmal tachycardia occurring in pregnancy and due to paroxysms of

auricular fibrillation alternating with flutter; quinidine rapidly abolished the attacks. He suggested that development of a transient flutter during the administration of digitalis in auricular fibrillation was not so rare as Dr. Moore supposed, and thought that in Dr. Moore's case resumption of digitalis because of the supervention of flutter was unnecessary.

Dr. MOORE, replying, agreed with Dr. Nesbitt that bundle-branch block was present in the third case he had described; he thought it was difficult to know what the outlook was, since some of these patients lived for quite a long time, and others did not. It was essential in giving digitalis to remember that it was a poison, and therefore should not be pushed too much; if coupled rhythm occurred it should be stopped at once. He believed that by using an electro-cardiogram toxic symptoms could often be avoided. He agreed with Dr. Abrahamson that flutter often replaced fibrillation after the giving of quinidine.

Pemphigus Foliaceus.

Dr. W. G. HARVEY read notes on a case of pemphigus foliaceus.

A man, aged 60, was admitted to the Adelaide Hospital on June 17th, 1928; he was a farmer, but had nothing to do with cattle and very little with sheep. He was completely covered by a profuse red scaly eruption, presenting the appearance of pityriasis rubra. He had had no skin trouble until about two months before admission, when blebs developed on the back and arms, which grew in size to a handbreadth or more. These blebs were at first discrete, but gradually coalesced to cover the entire surface of his skin. A month later the skin became scaly, but there were still some vesicles on the legs.

The temperature was then 99.6° F. in the evening and normal in the morning; it rose gradually in a fortnight to 101° F. A week before admission he had become somewhat delirious and was getting worse every day. At first the skin was in an inflamed desquamative condition, and the scalp was covered with thick crusted scales, making the features almost indistinguishable. Large flakes of skin were desquamating over the whole surface; the skin of the soles of his feet was separating en masse at the edge, like a slipper, and from the sides pus exuded. Pus of a dark grumous appearance was coming from his right ear. His mouth, tongue, cheeks, and fauces were intensely reddened and dry, with here and there greyish flakes of inspissated material. He was comatose, but next day became conscious, and though he rambled a good deal, he was at times quite sensible. He had all the appearance of a case of pityriasis rubra, but there was a peculiar sour smell somewhat reminiscent of the gas gangrene of war times. The history of the commencement of the attack indicated that the case was really one of pemphigus foliaceus. With the exception of the pus, there was little sign of moisture, and no blebs were observed at this time or during the period he was under Dr. Harvey's care; but the newly formed skin under the scales was easily detachable by firm rubbing, showing Nikolsky's sign. The urine contained a slight trace of albumin and a large amount of indican, which was constantly present.

The treatment adopted was calomel internally in 1/4 grain doses as an intestinal antiseptic, sodium bicarbonate, and arsenic. Locally, carron oil was applied and a glycerin preparation of lead subacetate; a mixture of glycerin and water was used as a lotion. Calamine cream and calamine lotion were also tried with and without ichthyol. The patient towards the end of his fifth week in hospital began to run a higher temperature, and died on July 24th.

Dr. O'MEARA read his pathological report of the finding of an acid-fast bacillus in numbers in the lesions—a unique finding. This bacillus was not, of course, the tubercle bacillus. On culture it did not yield any growth.

Dr. E. T. FREEMAN said there was no doubt that the condition was pemphigus foliaceus. He suggested that possibly the micro-organism was the smegma bacillus.

Dr. O'MEARA, replying, said that the organism which he had found did not resemble the smegma bacillus. As a rule this bacillus was not difficult to grow, and when it was remembered that the organism was growing on the surface of the skin in the case described, he thought that it would also have grown on artificial culture; an anaerobic culture might have been more successful.

The Value of Splenectomy in Banti's Disease.

Dr. F. J. O'DONNELL read notes on a case in which death followed splenectomy.

A boy, aged 6, had his spleen removed in 1926 for early Banti's disease. The operation checked his downhill course at the time, and subsequently he improved greatly.

On June 16th, 1928, he had headache and vomited three times during the day. The temperature was 102.6° F.; the pulse 120; and the respirations 24. Physical examination was negative except for a suspicion of a patch of pneumonia at one base. The boy was mentally quite clear, and complained chiefly of frontal headache.

Next morning the boy was looking intensely ill; there was a purpuric patch on the upper lip, the gums were bleeding, and black material was frequently vomited. He was restless and for the most part delirious. The head was slightly rigid, the pupils sluggish with photophobia. The temperature was 103.8° F.; the pulse was hardly palpable, and the heart sounds were feeble. During the day his condition grew progressively worse; the purpura spread widely on the face and similar patches appeared on the legs. The delirium and irritability grew more pronounced; in the afternoon the urine was bright red with blood, and by night the head was rigid. Death occurred the following morning; no necropsy was held.

Dr. O'Donnell said that the boy had died from an acute septicaemia, possibly of fulminating cerebro-spinal fever, but the case had also features of purpura fulminans. The boy's father had had his spleen removed in 1919, and had died later of septic pneumonia, manifesting a similar lack of resistance to the disease. The combined histories suggested some association between splenectomy and a diminution of the natural resistance of the body to disease.

Professor T. G. MOORHEAD said that this case raised a question as to the value of splenectomy in splenic anaemia. In recent years it had been universally accepted that surgery held out the only prospect of cure to sufferers from this disease; but in order to assess the value of surgery it was necessary to know the natural course of the disease when left untreated, and also to know the after-history of cases in which operation had been performed. Ordinary textbooks stated that untreated patients might live from fifteen to twenty years, and that the precirrhotic stage of the disease might last for as long as twelve years. As yet he believed no surgical statistics were available to show that life was prolonged or health permanently improved by operation, though there seemed to be no doubt that splenectomy was generally followed by an immediate and striking improvement in symptoms. Professor Moorhead remarked that Dr. O'Donnell's case was undoubtedly one of Banti's disease of the rare familial type; this had been proved by histological examination of the spleen. He also reported the after-history of three other cases in which splenectomy had been performed, but in two of these the operation had definitely not checked the course of the disease. One of the patients, though operated on in an early stage, continued after operation to suffer from progressive anaemia with haemorrhages, and died six months later. The other died two years after the operation, and in the intervening period had repeatedly suffered from haemorrhagic and thrombotic disturbances. The third patient lived nine years after the operation, but during all that time was anaemic and only fit for light work. Professor Moorhead said that a detailed account of the working capacity and the general health of patients on whom splenectomy had been performed for Banti's disease was urgently required.

Dr. G. E. NESBITT said he had always doubted the real value of splenectomy in these cases. He suggested that a statistical inquiry to determine the after-history of all cases in which splenectomy had been performed would be of great value.

THE OSLER CLUB.

THE Osler Club celebrated its first anniversary at a meeting held on Tuesday, April 30th. The secretary, presenting his report for the year, paid a tribute to the splendid work of the club's foreign secretary. Sir FARQUHAR BUZZARD, in a paper on the history of neurology, traced the growth from neurological aspects of other sciences of the independent science of neurology, for which he foresaw a future of great importance in the elucidation of the problems of education. Mr. FALCONER MADAN charmed the meeting with an address on Osler and Burton, full of the rare fruits of his wit, wisdom, and scholarship. Dr. J. D. ROLLESTON gave a brief account of the life and work of Billroth, and Sir D'ARCY POWER and Mr. W. G. SPENCER took part in the discussion. The club's collection of Osleriana was exhibited, together with portraits and works of Burton and of Billroth. Among those present were Dr. H. Morley Fletcher, Professor Gask, Dr. G. B. Harrison, Professor Fraser-Harris, Dr. Schroeder (of the Anglo-German Academic Bureau), Mr. Geoffrey Keynes, Dr. A. P. Cawadias, Mr. Hugh Cairns, Mr. C. Wilson, the Conservator of the Wellcome Historical Medical Museum, the librarian of the Royal Society of Medicine, and Mr. Philip Franklin

Reviews.

BILIARY DISEASES.

THE book by EVARTS GRAHAM, COLE, COPHER, and MOORE on *Diseases of the Gall Bladder and Bile Ducts*[1] was first published in 1928, and already has required reprinting, which may be taken as good evidence of its immediate success. In the second printing (1929) a short introduction, placed immediately after the preface, is the only addition, and gives the authors the opportunity of dealing with some minor criticisms which have appeared in previous reviews of the book. They explain how they wished to emphasize particularly the new work on the biliary tract, and therefore made no attempt to go fully into questions of differential diagnosis between biliary disorders and other diseases which may simulate them.

It is impossible to consider adequately all the features of interest in this book of nearly 500 pages, and some sections can only be named to show the completeness of the work. There is first of all an excellent account of the anatomy and physiology of the biliary tract, in which due allowance is made for many points, especially in physiology, which are still matters of controversy. Then follows a clear description of cholecystitis in its various forms, a disease of which the frequency and importance are gradually being recognized by physicians and surgeons alike. The medical treatment of acute cholecystitis is not adequately discussed, but this is inevitable in a book written by three surgeons and a radiologist. Gall-stones, their varieties, and the theories of their mode of formation are, as might be supposed, fully dealt with. Catarrhal jaundice and cholangitis are considered together, in accordance with the newer teaching, and the description of the various forms of cholangitis is to be warmly recommended as the most complete discussion of the subject available anywhere.

The subject of cholecystography naturally gets the fullest description from the authors, who are the originators of the method. This section, extending as it does to one hundred pages, with full references, must be regarded as the authoritative pronouncement on cholecystography, and is therefore indispensable to physicians, surgeons, and radiologists alike. Another long chapter of over fifty pages is devoted to the possible applications of tests of hepatic function in the diagnosis of biliary disease. All the various dye tests, sugar tests, and tests such as the van den Bergh reaction are fully described, and finally it is pointed out how the intravenous injection of phenoltetraiodophthalein provides at one and the same time both a "dye test" of hepatic function and an opaque substance for the radiological test of cholecystography. Hidden away in the chapter on tests of hepatic function is an interesting account of "white bile." Quite apart from the very great physiological interest of white bile, its presence always means an increased surgical risk in operations on the biliary tract. It is now agreed that "white bile" is the product of the walls of the main bile ducts, and collects in the ducts, as Rous and Drury have shown, in conditions of severe damage to the liver parenchyma when biliary obstruction is also present. Judd and Lyon at the Mayo Clinic found "white bile" nineteen times in operations on the common bile duct, and four of these nineteen patients died. The last long chapter of the book is devoted to surgical treatment of diseases of the biliary tract, medical measures being scarcely referred to, and this chapter is obviously meant for surgical readers alone. The index has been compiled with great care, and is entirely adequate.

The whole book is easily the best available on diseases of the biliary tract and their surgical treatment. The work of Evarts Graham and his colleagues and their development of the technique of cholecystography rank along with the more purely physiological work of F. C. Mann and his colleagues as among the best scientific and practical studies in medicine which have appeared in the United States of America in the last decade.

[1] *Diseases of the Gall Bladder and Bile Ducts.* By Evarts Ambrose Graham, M.D., Warren Henry Cole, B.S., M.D., Glover H. Copher, M.D., and Sherwood Moore, M.D. Second printing. London: Baillière, Tindall and Cox. 1929. (6 × 9¼, pp. xv + 477; 224 figures, 7 plates. 25s. net.)

The fourth volume of a series of German monographs on the practice of medicine, edited by Grote, Fromme, and Warnekros, is entitled *Die Erkrankungen der Gallenwege und ihre chirurgische Behandlung*[2] (diseases of the biliary passages and their surgical treatment), and is written by KÖRTE. It contains only about 170 pages, but is an excellent and complete summary of all modern knowledge on the subject. It is quite up to date and its completeness is extraordinary. We have searched for omissions of important details, but have not found them. As is common in German textbooks, almost all the references are to the German literature, and even in the section on cholecystography the name of the originator of the method, Evarts Graham of St. Louis, is merely mentioned without any references to his original papers. The twenty-six illustrations are remarkably good and clear, and there is an adequate index. The whole monograph gives a thoroughly sound account of the subject from the German point of view, and makes it easy for any reader to refer to all the recent German scientific papers dealing with diseases of the bile ducts and their surgical treatment.

MUIR'S PATHOLOGY.

PROFESSOR ROBERT MUIR'S *Text-Book of Pathology*[3] has established its reputation as a standard work on the subject, and as it has already been reviewed in these columns (April 15th, 1925, p. 787) it is unnecessary to refer to its general features. A second edition has now been issued, and a comparison with the former gives evidence of considerable revision in details, together with the addition of much new matter, entailing an enlargement of the work to the extent of a hundred pages.

The section on oedema has been revised and the recently recognized role of physical factors, as distinguished from the secretory activity of the endothelium, discussed. A very good account of the reticulo-endothelial system is given; much importance has been attached to this system in recent years, and the author makes some useful critical comments as to its significance. Similarly with regard to the interesting subject of tissue proliferation induced by special stimuli—for example, the stimulating action of embryonic juice on tissue cultures. Carrel has done much work on these substances, to which he has given the name of trephones, and considers that they play an important part both in repair and in tumour formation. The author gives a warning of the danger of applying the results of test tube observations to the more complex relations in normal tissues *in situ*. In a later part of the volume, under the heading of metaplasia, an excellent instance of a special stimulant of cell proliferation is given in connexion with J. S. Young's experiments, in which an injection of sudan III in olive oil with sodium cholate produced a marked proliferation of the cells of the pleural serosa, leading to an appearance *resembling transitional, and even squamous*, epithelium. The question of filterable viruses in connexion with the Rous sarcoma is fully discussed, including Gye's theory of the dual nature of the filterable agent. The author considers it questionable whether tumours of the Rous sarcoma type do not form a class by themselves, and finds it difficult to reconcile the view that a virus is concerned in tumour growth in general, with the results of the experimental production of cancer. An account is given of Mann's experiments on the extra-hepatic production of bilirubin. He and his co-workers have found that bile pigment is formed in the liver to a slight extent only; rather more is formed in the spleen than in the liver, and the chief source is the bone marrow. It may be, as the author points out, that the site of bilirubin formation differs in different animals, and it is impossible at present to say what is the normal site in the human subject. Among other matters added by the author and bringing the work up to date may be mentioned the recent researches

[2] *Die Erkrankungen der Gallenwege und ihre chirurgische Behandlung.* Von Professor Dr. Werner Körte. Medizinische Praxis, Band iv. Dresden und Leipzig: T. Steinkopff. 1928. (6 × 8¾, pp. xii + 183; 26 figures. R.M.10.)

[3] *Text-Book of Pathology.* By Robert Muir, M.D., Sc.D., LL.D., F.R.S. Second edition. London: E. Arnold and Co. 1929. (Med. 8vo, pp. vii + 872; 591 figures. 35s. net.)

on the cerebro-spinal fluid, rickets, the islands of Langerhans, and the so-called thyroiditis of Riedel.

A few additional illustrations have been included, but the general excellence of the figures in the first edition called for little alteration in this respect. A feature of the work which might be more generally adopted is the limitation of bibliographical references. It is customary either to give an extensive bibliography or to omit it altogether, and in neither case is the student much assisted. The middle course adopted by Professor Muir seems to be the right one—namely, to choose a few good books for the student, which will give him all the additional information he requires.

LARYNGO-PHARYNGEAL SYMPTOMS OF NERVOUS DISEASE.

THE monograph entitled *Kehlkopf und Rachen in ihren Beziehungen zu den Erkrankungen des Zentralnervensystems*[4] (larynx and pharynx in their relation to diseases of the central nervous system) recently produced by Dr. BÉLA FREYSTADTL contains a wealth of material which is of great value. Not only does it systematize in a manner which helps to emphasize their importance the well-known disturbances of laryngeal and palatal innervation, but it adds many new observations to those already current.

Too often, as Dr. Freystadtl has pointed out, the absence of any symptoms referred to the larynx or pharynx leads to perfunctory examination of these regions, whereas a more detailed and careful investigation will reveal defects which have been sufficiently compensated or insufficiently severe to be noticed by the patients themselves. It has been the author's task to show which of these slight defects are indicative of incipient disease and to estimate their significance. Many progressive diseases, involving widespread lesions in the central nervous system, have a characteristic order of attack upon the medullary nuclei. The particular onset and course of the functional impairment which results is sometimes pathognomonic of the disease, and Dr. Freystadtl shows how this knowledge makes it possible to differentiate between the various forms of bulbar palsy at a stage when other motor and sensory defects do not contribute to the clinical picture. If the nature of the lesion is thus suggested, its site may be as readily deduced from the same observations. The localization of small lesions around the aqueduct is greatly facilitated by our knowledge of the topography and connexions of the nuclei of the third cranial nerve. The information supplied for such localization by examination of oculomotor functions is furnished in the case of lesions in the lower part of the medulla by examination of the largyngopalatal mechanism. One difference which will be immediately appreciated between these two sets of apparatus—the visual and the laryngeal—is that, whereas stereoscopic vision demands such nicety of adjustment and co-ordination that diplopia, at least, may be complained of at a stage when defective movement can with difficulty be observed, the various functions of the larynx are less exacting and their impairment is later in appearing. Disturbances of breathing, of voice production, of swallowing, of speech, and even of taste are all dealt with by Dr. Freystadtl, who thus enlarges the field purposely beyond the strict limits of the larynx and pharynx. Spinal, bulbar, cortical, and motor nerve lesions have been considered separately: in the absence of exact knowledge as to the nature of myasthenia gravis no one will quarrel with its inclusion among diseases primarily affecting the bulb. The author has ranged widely in search of clinical and pathological data, and no obvious omissions present themselves. Vascular lesions of the bulb claim, of course, a prominent place among those under consideration, and the work of Foix and Hillemand, who have recently published a detailed account of this vascular supply, might have been usefully included in an attempt to systematize the lesions in that region. This monograph will prove of the greatest interest to neurologists, and is, within a comparatively narrow compass, complete.

[4] *Kehlkopf und Rachen in ihren Beziehungen zu den Erkrankungen des Zentralnervensystems.* Von Dr. Béla Freystadtl. Berlin: J. Karger. 1928. (Sup. roy. 8vo, pp. 325; 35 figures. M. 17.)

FORENSIC MEDICINE.

A THIRD edition of the late Dr. F. J. SMITH'S *Forensic Medicine and Toxicology*[5] has been published under the editorship of Dr. GEORGE JONES. This book consists essentially of the course of lectures given at the London Hospital Medical School, and within a compass of some 400 small pages it traverses the whole field of forensic medicine. This compression has certain advantages if the object is to place a summary of the subject before the student for examination purposes. If, however, the object of the book is to provide a real help to the student when dealing with cases in practice, then such compression tends to be destructive.

The chapters on law and procedure are full and informative and the general description of wounding and deaths from various forms of violence is adequate, but there is a distinct lack of practical detail throughout the various sections. In connexion with the examination of blood stains, a number of non-specific tests which are obsolete should be omitted, and the space utilized for a better description of more useful tests. In the toxicological section, the student is given a useful summary of the actions of the common poisons, but here again much more care should be exercised in the choice of material and the method of its presentation. For example, carbon monoxide and carbon dioxide poisoning are mentioned together, and no information is given about the dangerous concentrations of carbon monoxide, nor is the presence of this gas in the exhaust fumes from motor cars, geysers, etc., mentioned. The Poisons Act and the Dangerous Drugs Act and Regulations are insufficiently described in so far as they affect the young practitioner.

The editor has brought much of the subject-matter up to date, but the great amount of new legislation affecting practitioners of medicine and the advances in the various sciences related to the study of medicine make a revision of a small textbook a matter of extreme difficulty. Dr. Jones has, however, produced a very creditable new edition, which retains the individuality of the author and gives students a working knowledge of the subject of forensic medicine.

HOSPITALS AND THE STATE.

AMONG the numerous books and papers regarding the hospital question there is one which has an especial interest in that it deals with the history of the hospitals of this country. Dr. R. WESTLAND CHALMERS has written a most interesting little book, *Hospitals and the State*,[6] in which he traces the origins of hospitals as we know them, from the days when guests were so few that the stranger was always welcome, to the times when the great houses had their own strangers' halls, and so through centuries of private kindliness and charity to a stage where the hospital provided hospitality for the sick alone instead of for all. Three-quarters of his little book is filled with this most interesting story, in a series of chapters which are well documented and sufficiently wide in their scope to be informative. From hospital origins and hospitality we are taken to forced benevolences, to the policing of the poor, the growth of mediaeval hospitals, and their influence upon the public conscience; then to the philanthropist as a reformer, and the growth of collective philanthropy. Dr. Chalmers next discusses the modern situation, upon which he has definite ideas, and we may observe here that his book is much better than his foreword. There are half a dozen pages of this, and there is scarcely a hint in it of the interest of his historical survey; it is full of sneers at the "voluntary" system. It is strange that Dr. Chalmers should have written such caustic words on benevolence, for the main part of his book is in effect a eulogy of benevolence and of what it has effected. But the reason of his attitude is not far to seek. He has come to believe that the care of the sick is the sole duty of the organized State, and that

[5] *London Hospital Lectures on Forensic Medicine and Toxicology.* By the late Frederic John Smith, M.D., F.R.C.P., F.R.C.S. Third edition, revised by George Jones, M.B., M.R.C.S., L.R.C.P., D.P.H. London: H. K. Lewis and Co., Ltd. 1929. (Fcap. 8vo, pp. xx + 440. 10s. net.)

[6] *Hospitals and the State.* By R. Westland Chalmers, M.B., Ch.B., D.M.R.E. London: J. Bale, Sons, and Danielsson, Ltd. 1928. (Demy 8vo, pp. ix + 143. 6s. net.)

the State alone can effectively deal with the hospital problem, for which, as he rightly says, it is already responsible to the extent of some three-fifths of the work. Yet, despite the fact that the State is responsible for so much, he blames the voluntary hospitals for the defects he finds. "It becomes obvious that any reform of a practical nature will demand large financial resources if true economy and efficient methods are to be established against the hand-to-mouth and fumbling methods of the old-fashioned routine of voluntaryism."

AUSCULTATION.

In his little book on modern auscultation of the lungs[7] Dr. JUMON discusses the causes of the various normal and abnormal breath sounds. Some of his theories seem new and interesting. He believes, for instance, that the normal vesicular murmur is caused by the production of numerous fluid veins when the air passes through the muscular ring surrounding the mouth of each alveolus. This ring he calls the "bronchiole sphincter," and he states that section of the vagus, causing paralysis of the muscle, abolishes the murmur. The book consists of an introduction, three parts, and an appendix. The introduction deals with the history and anatomy of auscultation, and describes the technique. The first part describes the normal vesicular murmur, its causation, and its variations from the normal with regard to audibility. The second part, which is the largest, deals with the pathological variations of the murmur and with the various adventitious sounds. A brief description of the physical signs present in each of the diseases mentioned is given. The third part deals with those physical signs in which both percussion and auscultation are necessary simultaneously, and the appendix describes a system for recording the auscultatory phenomena graphically. The book is more interesting to the experienced clinician than useful for English-speaking students, as it only deals with one of the four necessary methods of routine examination of the lungs.

NOTES ON BOOKS.

PROFESSOR LYMAN is one of the best known and most industrious workers in the field of the ultra-violet rays, and the second edition of his book on *The Spectroscopy of the Extreme Ultra-Violet*[8] contains a wealth of facts and measurements unknown when the first edition appeared fourteen years ago. The volume is meant for physicists and the increasing number of experimental workers who deal with ultra-violet rays, and the apparatus connected therewith, from the physical, chemical, or biological point of view; the subject of therapy with these rays is not dealt with. The book is well written, full of information, and supplied with a long bibliography. It should be in the hands of all who are interested in the Schumann region of the spectrum.

Dr. ERNEST WARD is evidently a man of great energy and varied interests. In 1915 he helped to form an Association of General Practitioners for Collective Research, which obtained support in many influential quarters. The great war nipped the association in the bud, but in his book *Medical Adventure*[9] Dr. Ward has exhibited some of the problems with which such a body of general practitioners might deal. Many of his chapters were contributed to the *London Hospital Gazette*, and all are described as plain unvarnished narratives of the author's actual experience, recording observations and reflections along the by-paths of medicine. He begins his entertaining book with an account of legal adventures, from which the young practitioner may learn something of the pitfalls met with in giving evidence before a court of law: he will appreciate the usefulness of a well-turned phrase, but realize the advantage to be gained by adopting an inflexible ethical code. One of Dr. Ward's little stories may be quoted—that of a coroner's jury which, despite the advice of the coroner, insisted on returning a verdict that "the deceased died from a stone in the bladder, swallowed while lying in a gravel pit in a state of intoxication." The more serious and instructive parts of the book will be found in such matters as Dr. Ward's conclusions about the treatment of tonsils and adenoids, the treatment of tuberculous glands, the diagnosis of early tuberculosis, and the recognition of aberrant forms in infectious disease, such as measles. Whether his views on some of these topics are acceptable or not, they are appropriate matters for collective research by general practitioners. The book ends with a subjective study of encephalitis lethargica.

Wheat Flour and Diet,[10] by Professor SWANSON, and a practical guide to rational cookery,[11] by POZERSKI, HEMMERDINGER, LABBÉ (Mme and Dr.), and MARTEL, are books that have at least one common feature—namely, that they are written rather for a general than for a professional public. The first is an interesting survey of what, after all, is one of the oldest and most essential of human industries. The reader has before him a clear and simple account of milling, from the primitive quern to the modern American mill. In the latter part of the book there is a discussion of dietetics and of the nutritive values of various foods. A practical guide to rational cookery appears to embody a course of instruction given to students of the Société Scientifique d'Hygiène Alimentaire. It contains a short discussion of the scientific basis of cookery, practical instructions, and a large selection of attractive-looking recipes.

A pharmacopoeia for the King Edward VII Memorial Hospital, Bombay, has been compiled by Dr. A. S. ERULKAR, with the aid of a committee. It is arranged on the usual lines, the only exceptional feature being lists of the vernacular names of drugs. Copies can be had from the dean at the price of 2 rupees each and postage.

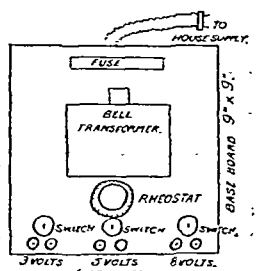
PREPARATIONS AND APPLIANCES.

A CONSULTING ROOM TRANSFORMER FOR SMALL SURGICAL APPLIANCES.

DR. E. M. R. FRAZER (Burton-on-Trent) writes: Most practitioners use small electric lamps in such pieces of apparatus as laryngoscopes, ophthalmoscopes, and head-lamps, but frequently find that the batteries supplied with these are run down, whether with use or disuse. A simple means of obtaining current of 3, 5, or 8 volts from the domestic supply is by a bell transformer, which is a small instrument about the size of a pocket-lamp, and costing about 5s. 6d. The domestic current is applied from a wall plug or lamp socket; at the other side of the instrument are terminals providing 3, 5, or 8 volts at 1 ampere. The transformer may be permanently mounted on a small board, to which are also fixed the three pairs of terminals necessary for the supplies. Between the transformer and the domestic supply a fuse of 3 amperes resistance should be placed (on the base board). The low voltage, of course, on an alternating current supply is also alternating. These transformers can be purchased for any domestic supply, and will be found to be most reliable. An added refinement is a small (wireless) rheostat in the 5-volt circuit to vary the amount of current. Such a board can be made up for about 15s., including fuse, terminals, three switches, rheostat, transformer, all wiring, and plug or adaptor for connexion to supply. The amount of current taken from the mains is infinitesimal. I append a sketch of the complete apparatus. The wiring is very simple, and can be carried out by any amateur electrician.



JACOBSON'S SOLUTION.

"Dr. Jacobson's Solution" (benzyl cinnamic ester), prepared by Messrs. Boots Pure Drug Company, is a solution in olive oil of benzyl alcohol and ethyl cinnamate, intended for intramuscular injection. Jacobson claims that a course of such injections (0.25 to 1.0 c.cm.) produces benefit in a variety of forms of tuberculous infections, including pulmonary tuberculosis. These claims have been supported by numerous articles in French medical journals.

SALICYLATE SOLUTION FOR INJECTION TREATMENT OF VARICOSE VEINS.

"Hypoloid" sodium salicylate is prepared in 20, 30, and 40 per cent. solutions and put up in hermetically sealed phials of 5 c.cm. ready for immediate intravenous injection. This preparation provides an alternative to solutions of quinine and urethane for the production of sclerosis in varicose veins. It is manufactured by Messrs. Burroughs Wellcome.

BRITISH CONGRESS OF OBSTETRICS AND GYNAECOLOGY.

(*Concluded from page 825.*)

BOTH morning and afternoon sessions on the second day of the congress were devoted to short communications on various subjects. Dr. FREDERICK EDGE was in the chair in the morning, and Dr. GORDON FITZGERALD during the afternoon.

SEQUELS OF UTERINE HAEMORRHAGE OF NON-MALIGNANT ORIGIN.

Professor J. O. POLAK (New York) read a paper on the follow-up results in 500 cases of uterine haemorrhage of non-malignant origin. He stressed the importance of absolutely careful examination and diagnosis to exclude such conditions as adnexal disease. He said that in the case of fibroids an attempt should be made to correlate the clinical manifestations with the site of the tumours. In the main he felt that fibroids were best treated by operation; the decision as to myomectomy or hysterectomy must be governed at all times by the judgement of the operator. Professor Polak showed very beautifully, by means of lantern slides, the effect which fibroids had on the blood circulation in the uterine wall. He advocated the use of radium in selected cases, never exceeding 300 milligram hours, and seldom 250 milligram hours in cases of idiopathic bleeding, but emphasized the importance of adequate drainage afterwards, if pyometra and other unpleasant sequelae were to be avoided. A routine examination of curettings was made as a preliminary in all cases.

Metropathia Haemorrhagica.

Dr. WILFRED SHAW (London) read a paper on metropathia haemorrhagica. He pointed out that in this disease, which was to be regarded in the nature of a clinical entity, the endometrium was thickened and in parts hyperplastic; cystically dilated glands were found, and there were areas of necrosis in the superficial and middle layers. These peculiarities of the endometrium were associated with constant disturbances in the function of the ovaries, which resulted in an inhibition either of the process of ovulation or of the full development of the corpus luteum. The follicle which was affected became cystic. The continuous vaginal haemorrhage complained of by patients with this disease was produced by necrosis in the superficial layers of the endometrium. Dr. Shaw suggested that the term "metropathia" should be employed to describe these cases, and that the various clinical types should be referred to under names which indicated the characters of the symptoms. Some overlapping was bound to occur, and it was mainly for this reason that the term "metropathia" was advocated for these cases.

The Cause of Cancer of the Cervix.

Dr. K. V. BAILEY (Manchester) read a paper entitled "An inquiry into the basic cause of cervical cancer; the pathology of cervicitis (cervical erosion), and the relation between cervicitis and cancer of the cervix." The investigation comprised the examination of 850 specimens of the cervix uteri with a twofold object: to ascertain the precise pathology of the so-called cervical erosion; and, with a thorough knowledge of this pathology as a basis, to inquire into the problem of the inception of cervical cancer. He considered there were two types of pathology of cervicitis: the relatively unimportant and rare condition of congenital erosion seen in the nulliparous, and presumably non-infected, cervix; and the large group of inflammatory erosions. Dr. Bailey believed the life-history of this condition fell into four stages: (1) the primary effects of irritation; (2) epithelial reaction; (3) replacement of columnar by squamous epithelium on the surface of the affected area; and (4) ultimate healing. These several varieties were illustrated by photomicrographs. Finally, Dr. Bailey traced the connexion between the reaction of the cells of the Malpighian layer to various strengths of irritants and the metaplastic changes that resulted.

The papers by Dr. Polak, Dr. W. Shaw, and Dr. K. V. Bailey were discussed together owing to their more or less intimate connexion.

Professor ADLER (Vienna) objected to the bare term "metropathia," since in many instances "ovariopathia" would describe the condition better in relation to cause and effect. He pointed out the frequency in these patients of cystic degeneration of the ovary, and cases of subacute inflammation where excess follicle ripening occurred. In young women he preferred to try corpus luteum and other glandular extracts in combination with iron, and at the menopause, if x-ray treatment failed, he advised vaginal hysterectomy.

Professor BLAIR BELL (Liverpool) commented on Professor Polak's restraint, emphasizing as he had his successes and his failures. The speaker added that he had also employed radium considerably, except in cases with fibroids, for at the menopause the trouble with fibroids did not end. Radium had only a very local effect on the endometrium and produced a sclerosis; the ovaries were too far away to be affected. He had often employed radium in the subinvolution of the menopause, but with great care and judgement; in cases where the cervix was badly lacerated he performed vaginal hysterectomy. He had not used radium for dysmenorrhoea, and did not believe very much in corpus luteum, since he thought the follicle fluid more reasonable. He stated that the cysts so often found in the ovary were irritant to the interstitial cells, and cited a case of ovarian grafting where he had to cut down on the graft and shell out a cyst before bleeding would stop.

Dr. FITZGIBBON (Dublin) divided cases into: (1) young women with retroversion; (2) those menopausal women in whom the uterus had undergone atrophy but whose ovaries were still active. In such cases the atrophic uterus was unable to control bleeding. In young women large ovaries were frequently found at laparotomy; for these he had employed a wedge resection operation, and corrected the uterine deformity with good results. He had had a small experience with radium, which he found of value in its sclerosing effect on the endometrium.

Mr. T. G. STEVENS (London) disagreed with some of the previous speakers who had referred to the excess of fibrous tissue over muscle in these cases. He stated emphatically that it was in the arterioles that excess elastic and not fibrous tissue was laid down.

Dr. BETHEL SOLOMONS said that curettage was nearly useless in excluding malignant degeneration which might be present in a tumour far away from the endometrium; therefore, unless there was some constitutional contra-indication to operation, he did not believe in radiotherapy. He had had six cases of abdominal malignancy in women who had been treated in this way for fibroids. Recently a patient for whom he had recommended hysterectomy two years previously, and who had chosen radiotherapy, returned suffering from a large tumour. At operation he had removed two carcinomatous ovarian tumours and a uterus full of fibroids; these had persisted in spite of the stopping of menstruation. The blood changes in connexion with radiation must be considered. When a patient was highly anaemic he advised a bloodless hysterectomy without previous transfusion; it arrested further loss, and gave excellent results. He believed that radium should be inserted by the gynaecologist under the guidance of an expert radiologist. He inquired when retroversion was present whether operation or pessary was used before the insertion of radium; also whether any of the young girls were sterilized by the radium. He believed that if the correct hormone were discovered the haemorrhage could be controlled; in addition, many of the old-time drugs could be tried, since these were sometimes successful.

Dr. POLAK, replying, said that the object of his paper had been to show the limitations of radium. If a retroversion was present results with radium were bad owing to inefficient drainage. In submucous fibroids, unless sessile, radium should not be used. Dr. SHAW said he had found the corpus luteum extracts sold in this country quite useless, and that other glands were not to be forgotten.

USE OF GLYCERIN IN OBSTETRICS AND GYNAECOLOGY.

Dr. CAROLINE ELLIOTT (Edinburgh) read a paper on the use of glycerin in obstetrics and gynaecology. After discussing at some length the rationale of the use of glycerin, Dr. Elliott drew a contrast between patients who had been treated prophylactically (those who had had major obstetrical intervention, or who had become septic as a result of intervention at delivery) and patients who had been delivered without complication but had afterwards shown morbidity; a large number of the latter were from the venereal department. The technique of administration consisted in the introduction, under very low pressure, of two ounces of unsterilized glycerin into the uterus; smaller amounts of glycerin were used in other cases.

Mr. LOUIS C. RIVETT (London) asked if a comparison had been drawn between cases treated during a year and those in years when no glycerin was used. He felt that this procedure had a very definite place in the treatment of puerperal sepsis, but unless cases were suitably selected the procedure would be abused. Dame LOUISE MCILROY (London) referred favourably to the use of glycerin in the differential diagnosis of pelvic peritonitis and frank appendicitis. She believed in frequently repeated injections of small quantities, for which purpose a rubber catheter was stitched into the cervix, and the ward sister could then perform the injections. Dr. CRAWFORD (Liverpool) referred to the efficacy of the treatment in septic abortion, but stated that she had seen unpleasant reactions follow its use. Dr. LACEY (Liverpool) said he had been using glycerin and chloramine owing to the difficulty in sterilizing glycerin.

THE EXTENDED VAGINAL OPERATION FOR CERVICAL CANCER.

Professor ADLER (Vienna) read a paper entitled "Results in 1,000 cases of the extended vaginal operation for cancer of the cervix." He referred to the growth in favour of the Schauta operation; he commented on its low primary and remote mortality, and on its high percentage of five-year cures, which had shown a steady increase with the passing of two decades until, with the additional employment of post-operative radiation, the percentage reached the wonderful figure of 58.8. Professor Adler, by means of lantern slides, demonstrated most clearly the steps of the operation, pointing out the ease of access to the ureters and parametrium, the short time the peritoneal cavity was actually open, and the absence of shock, more especially since the adoption of local anaesthesia.

COMPLICATIONS OF OVARIAN TUMOURS.

Professor J. HENDRY (Glasgow) read a most interesting description of cases, and showed actual specimens of ovarian tumours which were associated with complications, either obstetrical or gynaecological.

Dr. BETHEL SOLOMONS said that the discussion two years hence precluded many remarks at present; he felt, however, that several main themes were suggested for the future paper. The most important were the malignancy, extent of malignancy or maturity, and the non-malignancy of the tumour. The results of *x*-ray treatment after removal of the tumour were excellent. It was difficult to answer the questions whether both ovaries should be taken away, and also the uterus.

ECLAMPSIA AND ITS RENAL LESION.

The morning of the third day of the congress was occupied by the reading of short communications. Mr. R. H. PARAMORE (Rugby) contributed a paper on eclampsia and its renal lesion.

Mr. Paramore opened his argument by pointing to difficulties in the acceptance of the toxaemic explanation of the visceral lesions of eclampsia—both in the case of the liver and in that of the kidney. In eclampsia, since the periportal cells became degenerated while the central cells escaped, if the implication of the periportal cells was due to a poison, then the periportal cells must be different in nature from the central cells. In the symmetrical necrosis of the renal cortices, since the inner third of the convoluted tubules remained intact, on the supposition that the outer parts of these tubules were destroyed by a poison, the cells of the inner and outer parts of these tubules, similarly, must be different in nature from each other. The speaker believed that these lesions were produced mechanically. He reviewed the vascular mechanism in the kidney, pointed out the importance of the arteriae rectae, and showed that the renal lesions of eclampsia were the associated effect of a compression of the kidney and an engorgement of the medulla with blood. He argued that in experimental diuresis a distension of the cortical tubules occurred; if the ureter was clamped the distension of the cortical tubules was exaggerated, and the kidney became almost bloodless. In eclampsia the oliguria could not be regarded as an expression of the needs of the body: the cause of it must exist in the kidney. The distension of the Bowman's capsules and of the convoluted tubules showed that an attempted diuresis had been in play, and that the oliguria was not due to a vaso-constriction of the renal arterioles or to an inability of the renal cells to work. The oliguria was thus the result of an obstruction to the outflow of urine, and the only place of such obstruction could be the medulla. *Microscopic examination of the medulla* showed that in eclamptic states it was congested and turgid with blood.

The circuitous route of the uriniferous tubules and the passage of casts when diuresis was induced indicated that obstruction of the tubules in the medulla could and did occur. The blockage could only be caused by a compression of the whole kidney, in which the medulla, invested by the cortex, was implicated; and—after the relief of the compression (as, for example, by taking a breath)—by an engorgement of the medulla with blood. The proneness to oliguria of strong primigravidae, of women with twins, and of women with progressive concealed accidental haemorrhage, was mentioned. The oliguria was instituted by direct pressure on the kidney, but was maintained during resting states by vascular engorgement of the medulla. At the moment of decompression, blood could enter the medulla from the renal arteries more readily than urine could escape from the cortex; thus a high blood pressure usually obtained. Reference was made to the occasional bad effect of delivery on the pre-eclamptic patient; and it was pointed out that even in the non-pre-eclamptic patient delivery might be followed by anuria. This was explained by supposing that at the time of delivery the kidneys were in a state of stress, all the cortical tubules being distended and the capsule investing the organ being already tight. On emptying the uterus the pressure on the kidney was greatly reduced, but the organ, because of its capsule, could not expand. Thus blood from the renal artery was unable to enter the cortex, and was thus forced into the expansile medulla, engorging this part and effectually preventing the exit of urine from the cortex. Proof of this conception was afforded by the evidence of decapsulation: the way this operation worked was shown. The conditions arising in pregnancy were similar. The renal lesion of eclampsia was due to an inability of the urine to escape from the cortex: this prevented blood entering the cortex, and thus the renal cells suffered degeneration and necrosed.

This paper was discussed by Drs. FAIRBAIRN, HOLLAND, and FITZGIBBON.

DOUBLE MONSTERS.

Dr. A. L. MUDALIAR (Madras) read a paper entitled "Double monsters—a study of their circulatory systems and some other anatomical abnormalities, and the complications in labour." Referring to the circulatory system Dr. Mudaliar showed a most interesting selection of specimens ranging in type from the very primitive, almost amphibian, character of the chambers to monsters with two almost separate hearts. The specimens comprised: thoracophagi, including tetrabrachius tetrapus, tribrachius dipus, and dibrachius dipus (anencephalic); syncephalic, including tetrabrachius and tetrapus; craniophagus; and ischiophagus. Dr. Mudaliar discussed their obstetrical significance, diagnosis, prognosis, methods of treatment, the separation of fused twins, and the *x*-ray findings.

Professor GATENBY (Dublin) spoke shortly on polyspermia as a cause of these conditions, and mentioned the experiment of Stochard in producing a cyclopean fish by changing the osmotic pressure of its medium.

Professor GREEN ARMYTAGE commented on the association of excess of liquor amnii with monsters, and stated that a large percentage of monsters were female.

FOETAL DEATH AFTER QUININE INDUCTION.

Drs. W. J. DILLING and A. A. GEMMELL (Liverpool) reported a preliminary investigation of foetal deaths following quinine induction. This investigation comprised a series of 765 cases in which quinine was used for induction, and the drug may have been responsible for eight stillbirths (1.04 per cent.). Judged from the point of view of weight gained or lost on the tenth day after delivery there was no evidence in a series of 201 cases that quinine had a detrimental effect on the nutrition of the children who survived. From the rate of excretion of quinine in the mother's urine the maximal concentration of the drug in her tissues after receiving three doses of 10 grains at hourly intervals occurred from the sixth to the eighth hour after the first dose, but the period of high concentration might persist until thirty-six hours afterwards. It was not possible to prove by the thalleioquin test the presence of quinine in foetuses of rabbits which received doses of quinine; nor in the liver or kidneys of an infant, stillborn within twenty-four hours of the last dose of quinine given to its mother. The presence of quinine to the extent of 0.015 per cent. was demonstrated in the urine of infants born six to twelve hours after the last dose of quinine to the mother. This concentration was held to be sufficiently high to merit investigation with regard to the toxicity of quinine on foetal tissues. No decisive evidence of quinine in the foetal (placental) blood was obtained. The presence of quinine nine to eleven hours after administration had been discovered in the liquor amnii to the extent of about 0.006 per cent.

PREGNANCY FOLLOWING OVARIAN RADIATION.

Dr. MILES PHILLIPS (Sheffield) read a paper entitled "A successful pregnancy following *x*-ray stimulation of the ovaries after ten years' amenorrhoea." He stated that a short review of the literature showed that a number of normally developed children have been born after *x*-ray therapy directed to the ovaries in certain cases of amenorrhoea accompanied by sterility. He described the case of a nullipara who after ten years of amenorrhoea had menstruated promptly after the treatment, and soon became pregnant. The child was delivered by Caesarean section. He gave details of the appearances of the ovaries. Dr. Phillips pointed out the necessity for correct spacing of the *x*-ray exposures in order to prevent radiation of the newly fertilized ovum.

Professor DAVIDSON (Dublin) mentioned a case in his practice of a woman, aged 40, who had been married for twenty years but had had no children. Her menses were becoming steadily more excessive. He tried *x* rays, using one-fifth of an erythema dose, and gave eleven exposures over a period of three weeks. The menses became less, and nine months later they *stopped*; *pregnancy* was found to have occurred and a normal delivery followed. It seemed clearly proved that instead of sterilizing the woman the *x* rays had stimulated the ovary.

Dr. JOHNSTONE (Belfast), concluding the discussion, urged the necessity of not regarding menstruation as the all-important factor. He reminded the meeting of cases of pregnancy occurring during lactation.

Dr. BETHEL SOLOMONS believed that there was a great future for this form of treatment; he had had several cases of menstruation following prolonged amenorrhoea. He believed, however, that *x*-ray treatment should be left until the last, and that trial should be made of hormonic preparations and other stimulating drugs.

Among the other papers read at the congress was one by Dr. G. I. Strachan (Cardiff) on the different methods of technique in the application of radium to uterine carcinoma. (A paper by Dr. Strachan dealing with this subject is published in this issue of the *Journal* at page 842.)

An exhibition of pathological specimens was arranged and aroused considerable interest. Various operations were demonstrated on the afternoon of the last day of the congress. A reception was given by the President and Mrs. Gibbon FitzGibbon at the Royal College of Surgeons during the evening of April 24th. The congress dinner was held at the Royal College of Surgeons on the following evening with the President in the chair.

LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY.

THE annual general meeting of the London and Counties Medical Protection Society was held on May 1st at Victory House, Leicester Square, under the presidency of Sir JOHN ROSE BRADFORD, P.R.C.P.

The council reported another year of useful work, with a substantial increase in membership. The new members elected during the year numbered 977, of whom 337, having applied for membership within a year of their registration, were exempt from entrance fee. At the end of 1928 the number of members was 11,492. Applications for advice and assistance were received during the year to the number of 1,067. In the majority of cases satisfactory results were obtained without litigation. The solicitors of the society again refer to the growing critical and litigious spirit of the general public. While the society had been spared spectacular legislation, there had been heavy calls upon its resources during the year, and the cases dealt with had been of unusual number and variety. Cases arising under the National Health Insurance Act were increasing. "It is a matter of surprise to us," say the solicitors, "that those responsible for watching the interests of the medical and dental professions, and bodies concerned in matters pertinent to those professions, are so powerless to prevent the growth of bureaucratic power which can usurp jurisdiction designed to give citizens the fairest form of trial, and can vest in one man, who, by virtue of his statutory powers of making regulations, can pass what are virtually laws affecting so large a number without their having a word to say antecedent to such regulations becoming effective, a power of decision and sentence without right of appeal." An extraordinary number of cases of the breaking of hypodermic needles in the course of injection came before the society during the year, and a legal decision as to responsibility would be of great value, but up to the present it has not been possible to get a test case.

Sir JOHN ROSE BRADFORD referred regretfully to certain losses by death, notably Dr. G. W. Hill, a regular attendant at council meetings, Sir Anthony Bowlby, a trustee, and Mr. A. Neilson, K.C., who for many years had assisted the society on its legal side. A great deal of the work of the society, said the president, arose from the unfortunate attitude sometimes taken by patients in their relations to members of the profession, but he was bound to say in the same breath that some of the work might be diminished if the members of the profession took more precautions, especially in safeguarding their interests in that class of case in which they were most liable to attack—namely, fractures. In many cases, even during the last year, the defence of members had been embarrassed because they had not made an *x*-ray examination or had not secured evidence of having advised such an examination and of the advice being rejected. He added that there was a slight deficit on the year's work—nothing like so much as in some former years, and not one to cause any anxiety in view of the strength of the society's assets and of the inevitability in such a society of single years or even a succession of years of abnormally heavy expenditure.

On the motion of Dr. C. M. FEGEN, Sir John Rose Bradford was re-elected president, with hearty thanks for his past services; Dr. Fegen himself was re-elected treasurer, with similar compliments. Other re-elections were of the vice-presidents, Dr. R. L. Guthrie taking the place of the late Sir Anthony Bowlby; and of the retiring members of council, with the addition of Mr. William M. Morrison. A hearty vote of thanks was accorded to the society's solicitors, Messrs. Le Brasseur and Oakley, upon the soundness of whose advice and judgement, said Sir John Rose Bradford, the society had had occasion to rely on innumerable occasions, to its great satisfaction.

INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY.

LONDON, MAY 6TH TO 11TH, 1929.

THE fifth International Congress of Military Medicine and Pharmacy was held in London from May 6th to 11th. It was attended by nearly 800 members, including official delegates from close upon forty countries, as well as from the League of Red Cross Societies and the International Committee of the Red Cross. The House of the British Medical Association in Tavistock Square was the Congress centre. The Great Hall was used for the principal meetings, and the newly completed extension accommodated the reception office, a large exhibition of service equipment, and writing and club rooms for the members and the ladies accompanying them.

The varied and spectacular character of many of the foreign uniforms excited much public interest. When the members gathered in the quadrangle on Monday morning for a panoramic photograph they presented a kaleidoscope of colour. While the British khaki and the French blue predominated, a gorgeous note was struck by some of the head-dresses and breast decorations of the visitors. The delegates then visited Westminster Abbey, where, in the north transept, a procession was formed to the Tomb of the Unknown Warrior. Here the procession was awaited by the Dean and Canons, and a wreath was deposited.

On Monday afternoon the opening ceremony took place in the Great Hall, the platform of which was decorated with large banks of hydrangeas, roses, and other flowers. The Secretary of State for War, Sir Laming Worthington-Evans, Bart., M.P., performed the opening ceremony. He was supported by the President of the Congress, Lieut.-General Sir Matthew H. G. Fell, K.C.B., Director-General, Army Medical Services, Sir Ewen Maclean, President of the British Medical Association, and by two distinguished foreign delegates—namely, General Lanne of the French Army Medical Services, and General Stanislas Rouppert, Director of the Medical Services of the Polish Army, and President of the fourth congress, held at Warsaw in 1927.

Others on the platform were:

Surgeon Vice-Admiral Gaskell (Medical Director-General of the Navy), Air Vice-Marshal D. Munro (Director of Medical Services, Royal Air Force), Sir Leonard Rogers (Medical Adviser, India Office), Colonel Sir Lisle Webb (Director-General of Medical Services, Ministry of Pensions), Sir John Rose Bradford (President, Royal College of Physicians), Major-General Sir Alfred Blenkinsop (representative of the British Medical Association on the Organization Committee), and the following delegates from abroad:

Surgeon-General Hugh S. Cumming (chief of American Public Health Service), Major-General Bauar (Director-General, Swedish Medical Service), Don Agustin Yan-Baumbergher (Spanish Ministry of War), Major-General Commandante Umberto Riva (Italy), Tenente Colonello Dr. Arturo Casarini (Italy), Major-General J. C. Diehl (Netherlands).

WELCOME BY THE SECRETARY FOR WAR.

Sir LAMING WORTHINGTON-EVANS, in formally inaugurating the Congress, welcomed the delegates from the various countries, also the representatives of the Red Cross and Voluntary Aid Societies, whose beneficent work had done so much to alleviate the hardships of war. It was inspiring to think that in the field of medicine, at any rate, the nations of the world had reached a unanimity of aim and endeavour which was still far to seek in the realm of international politics. The reason was that the medical and nursing services in the different countries were all ranged on the same side against a common enemy—namely, disease and injury—and the cause which they all served transcended those rivalries and differences which added such difficulty to the statesman's task. Was it not inspiring, too, that in the sphere of military medicine it was possible to meet together and exchange freely the fruits of separate research, secure in the knowledge that, whatever might happen in the future, these would never be used save in the name of humanity?

"Yours," said Sir Laming, "is an easier task than that of the statesman. You can identify the enemy against which you are combining. You may not always know whence he comes and whither he goes, but you can recognize him as an enemy. The statesmen are in greater difficulty. While wishing to combine against war as you combine against disease, they cannot so easily identify the cause of war. You are leading in this matter of co-operation, and I hope the statesmen may follow with equal success."

The Minister then commented on the variety of the programme provided, including as it did visits to the naval centre of Portsmouth, the military station of Aldershot, and the establishments of the Royal Air Force at Halton. He thanked the British Medical Association for so generously placing at the disposal of the Congress its magnificent hall and other buildings.

It had been intended that at the conclusion of the ceremony in the Great Hall the War Secretary should proceed to the Exhibition and open it, but owing to a meeting of the Cabinet which called him away he was unable to fulfil this part of the programme. He did, however, visit the exhibition before leaving.

THE PRESIDENT'S INAUGURAL REMARKS.

Lieut.-General Sir MATTHEW FELL, the President of the Congress, said that the British members of the Services extended a most hearty welcome to their colleagues from all parts of the world. This Congress was the fifth of a series which had taken place since the Armistice, the others having been held in Brussels, Rome, Paris, and Warsaw. The congresses had their origin in the meetings of the consulting surgeons of the inter-allied armies in the West during the war. Dr. Tuffier of Paris, who was president of those inter-allied conferences, had been deeply impressed by the benefits derived from them, and was desirous that some means should be found of continuing in peace the international exchange of ideas and experiences which had been so profitable in war.

The medical services of armies must necessarily function in accordance with the principles and limitations required by the army organizations which they existed to serve. To some degree, consequently, they must vary in every army, just as they must vary with the climate and terrain in which they operated. During the progress of war there were limits prescribed by purely military necessity. But the main objects of the services were the same for all armies—namely, the maintenance of the highest standards of hygiene and sanitation, and the elaboration of an organization which, with the least possible delay, could bring to the sick and wounded the fullest benefits that medical science could apply. Within these service medical organizations functioned the Red Cross and the great voluntary aid societies, without whose generous and freely given assistance the lot of the stricken soldier in war would be still harder.

Those who read the story of medical aid in war (continued Sir Matthew Fell) could not fail to be struck by two things. The first was, quite apart from any humanitarian considerations, the comparatively recent acceptance of the advantages to an army, both in peace and in war, of a highly organized medical service. It was true, as might be seen by memorial tablets erected at York and on the Roman wall and in other places in Great Britain, that two thousand years ago the Roman legions possessed their own medical service. But it was not until the Napoleonic wars at the beginning of the last century that any real advance was made in medical organization. In the middle of that same century, again, the war in the Crimea gave to history the name of Florence Nightingale, and opened to women of education and position the service of nursing, both military and civil. The Geneva Convention and the vast developments of the International Red Cross had their origins even within living memory.

The second impression from the study of medical aid in war related to the indubitable effect which war had had

in accelerating the general application of the discoveries of medical science. He recalled being present in that hall two years ago at the centenary celebrations of the birth of Lord Lister, and although only one of those who gave addresses on that occasion referred to the benefits which Listerism had brought to the wounded in war, it was impossible not to feel certain that, at any rate on the Continent of Europe, those nations who nearly sixty years ago saw their wounded die by the thousand of surgical infections had felt urged to press forward—and had in fact pressed forward—the principles which Lord Lister preached, but which in England were only tardily accepted. Anyone who cared to read the short personal account by the late Sir William MacCormac of his experience with an ambulance in the war of 1870 must feel that that was true. Again, the more recent British experience of the war in South Africa, with its terrible losses from enteric disease, undoubtedly stimulated the brilliant band of research workers, whose names would occur to all those assembled, in the elaboration of a method of prevention by vaccine treatment which had proved of benefit to humanity throughout the world.

In conclusion, Sir Matthew Fell mentioned the many difficulties attendant upon the preparation for such a Congress as the one now beginning. Not least among them was the fact that the people of our island nation lacked a knowledge of other languages than their own, which he trusted the visitors from other countries would pardon. He also thanked the British Medical Association for the generous offer of its House. His final word, which elicited hearty and general applause, was an expression of his belief that the efforts of statesmen throughout the world to-day to make war impossible were watched by none with more sympathy than by the members of the medical services, whose sphere of duty brought them into intimate contact with all the horrors which war involved.

Responses from Delegates.

M. Lanne, Inspector-General, French Army Medical Services, acknowledged on behalf of the visitors the welcome extended, and made a sympathetic reference to the King's illness, praying for His Majesty's complete restoration, and affirming that his illness had evoked the sympathy of the whole world. In pooling the knowledge and experience gained by the various medical services the Congress was assisting the cause of humanity.

General Stanislas Rouppert, Director of Medical Services of the Polish Army, said what pleasure it gave him to be present, more especially as he had presided over the previous Congress, held in Warsaw. His fellow officers in the Polish Army regarded these Congresses as a unique opportunity for instruction and encouragement.

The Exhibition.

After these proceedings a move was made towards the exhibition, in which the delegates and members spent some time. In the trade exhibition about seventy firms contributed; almost all of them were familiar to visitors to the exhibition at the Annual Meetings of the British Medical Association. In addition to the commercial display, there was a service exhibition of the equipment used in the Royal Navy, the Army, and the Royal Air Force. This included medical and surgical stores for service afloat; apparatus employed in the investigation of ventilation conditions in H.M. ships and naval establishment (shown by the Department of Hygiene, Royal Naval Medical School, Greenwich); army field medical equipment, and the medical equipment of the Royal Air Force. Among the items of special interest in this last exhibit were the Reid flying aptitude apparatus, Flack's rebreather bag, and the rotating chair, sphygmomanometer, and other apparatus used to ascertain the effects of rotary movement; also electrically heated clothing for high altitude flights.

Reception by the Prince of Wales.

The principal delegates were afterwards received by the Prince of Wales at York House; they were presented to His Royal Highness by Sir Laming Worthington-Evans.

Government Dinner.

On Monday evening, at the Hotel Cecil, a dinner was given by the Government to the principal official delegates and distinguished visitors. About 120 sat down at the tables under the presidency of the Right Hon. Sir Laming Worthington-Evans. Among British medical men, in addition to the principal officers of the services invited to meet the guests from abroad, were the following: Sir John Rose Bradford, P.R.C.P., Lord Moynihan, P.R.C.S., Sir Lenthal Cheatle, Sir Richard Luce, Sir Ewen Maclean (President, British Medical Association), Mr. N. Bishop Harman, Sir George H. Makins, and Lieut.-Colonel C. T. Samman (Master of the Apothecaries' Society).

The oratory was brief, because the tireless visitors had still another engagement in the shape of an official Government reception at Lancaster House. After the toasts of "The King" and of "The Sovereigns of the Kingdoms and Presidents of the Republics represented" had been honoured, Sir Laming Worthington-Evans proposed the health of "The Guests." He expressed the hope that the friendships formed at the Congress would outlive the few days of the meeting. These congresses were of immense value, he believed, from the professional point of view, but they had also a wider significance because they fostered international understanding, and helped to form a public opinion in all the countries represented, which would be of real assistance to the labours of those working in the interests of world peace. It was difficult for a layman to keep pace with the advances made in medical science. Experience in the great war showed that on the Western Front the risk of death from disease was much smaller than the risk of death from enemy action, whereas in all former wars in the same area the balance of risk was reversed. In peace time also the standard of health maintained in the armies was not unimportant. Thanks to the medical profession, noteworthy advances had been made, to the benefit of officers and men, as well as to the relief of the public purse.

Brief replies were made by General Stanislas Rouppert (Poland) and General Demolder (Belgium). The former referred to the great traditions of British medicine and military science. The latter similarly praised the British people, not only for their eminence in arts, literature, commerce, and industry, but for their great example in charity.

THE FIRST SESSION.

Evacuation of Sick and Wounded.

The first discussion of the Congress took place on Tuesday morning, under the presidency first of Surgeon Vice-Admiral Gaskell, and later of Air Vice-Marshal Munro. The subject was the evacuation of sick and wounded by water and by air.

Evacuation by Sea.

Surgeon-Commander A. Yavasour Elder, R.N.V.R., dealing with evacuation by sea, drew attention to the various administrative and clinical problems of water transport. Such transport, he said, was invariably subject to local and weather conditions, so that it was impossible to lay down any fixed routine. He described the various methods of transferring cases by hoisting. He also put forward as a constructive suggestion for inquiry as to practicability the establishment of a water transport service, in future instances of combined naval and military operations, for casualties in all branches of the armed forces. This would be organized and operated by the Naval Military Service, the land transport of sick and wounded being allocated to the military medical authorities, and cases requiring transport by air would naturally be dealt with by the Air Force Service. On the clinical side, he mentioned the use of morphine, saying that while its administration could not be left to the initiative of unqualified persons, more lives after action had been lost through unrelieved "shock" than by the administration of this drug. The sedative effect of tobacco should be remembered, and, except in cases of gas poisoning, cigarettes and matches provided.

M. OUDARD, Médecin en chef de la Marine Nationale, spoke of the construction of the hospital ship, which, he said, must be very seaworthy, strongly built, stable, and silent, with the minimum of vibration; the average size should be 8,000 tons, and the speed 15 knots. The wards should have from 25 to 100 beds, with not less than 6 cubic metres of air per person. Isolation wards and one or more padded cabins should be provided. Surgical services should be on deck in one or more complete operating rooms. He also spoke on the several problems of international law which were raised by the evacuation of wounded by sea, which would justify a revision of The Hague Convention of 1907.

The Air Ambulance.

Group-Captain HARDY WELLS, R.A.F., introduced the subject of evacuation by air. The aeroplane, he said, was the quickest and easiest means of transport. It enabled serious cases to be treated early, and hospitals to be centralized, thus making for economy in hospitalization. Its limitations were those imposed by weather, and also the necessity of having landing grounds adjacent to hospitals. The employment of the aeroplane depended very much on the type of war, whether a "great war," a "small war," or a "tropical war." In a great war, with the front line continually under shell fire, the employment of aircraft on ambulance work in the area would be impossible. The nearest position for such work would be somewhere outside this area. The plan he suggested was to have advanced mobile hospitals, with landing grounds reasonably adjacent, connected by a light railway. It could not be expected to clear large numbers by air, but those serious cases which crowded up the clearing hospitals could be sent down to the stationary or base hospitals by this means. In a small war, with a force operating from an established base, and columns moving up, casualties could be removed direct from the field ambulance to stationary hospitals, the air route being extremely useful when the intervening country was unsafe. Aircraft solely employed on ambulance work should be under Red Cross protection. Difficulty would arise as to identification, and he suggested that the whole aeroplane be painted red and a red cross with white edges picked out.

Lieut.-Colonel SCHICKELÉ (France) said that ambulance aeroplanes must now be considered a routine method of evacuation. In a European war, if they were used on a considerable scale, they must be made in large numbers and be chiefly of the large carrier type. It did not seem possible, however, for the large aeroplane to get beyond the army corps area (10 to 15 kilometres from the front), though the small aeroplane might be in contact with the medical divisional formations (5 to 8 kilometres). The helicopter should give new facilities in the front area. With regard to the airship, he could not contemplate this means for the evacuation of casualties. The seaplane, again, would always be less seaworthy than the boat, and could only be used with any chance of success in a calm sea. In naval warfare its use was problematical, and apparently would be restricted to the rendering of aid to damaged battleships which had taken refuge in sheltered roadsteads. The use of ambulance aeroplanes raised several problems of international law for which a solution should be sought.

The other speakers who briefly participated in the discussion were Colonel SAINT-SERNIN, Colonel A. VAUDREMER, and Colonel H. S. ROCH. The last-named gave an interesting account of his experiences with a small military column, 5,000 strong, on the frontier of Kurdistan in 1923. The country was almost inaccessible, and evacuation by any other means than air would have been of the utmost difficulty. It would have meant hand carriage for any period from two to eight days; but through the help of the Air Force it was possible to move the casualties the same distance in four hours with the utmost comfort. The limitations of which Group-Captain Wells had spoken were exactly those which he had experienced in Kurdistan—namely, weather and landing grounds. While his column was in a hopeless part of the country there was constant rain for a fortnight, and the camp became a perfect morass, a sea of mud, in which it was hopeless to operate. Under these conditions a man went down with acute appendicitis, in which immediate operation was desirable. An S O S was sent to the Air Force, which dispatched a machine, but on two successive days the weather prevented landing. On the third day the weather cleared, and the plane landed and took away the man, who within a few hours was on the operating table, and made a good recovery. The method was to wrap him in blankets, in the army stretcher, which was strapped to the machine-gun fitting in the plane. With regard to landing grounds, Colonel Roch said that he could also speak from experience of some of the roughest country it was possible to find. No landing was possible nearer than twenty-five miles, and there were 150 sick and wounded. The serious cases were carried on stretchers, the others put on donkeys, and it was three days before advantage could be taken of the help of the Air Force, though even so, if it had not been for the Air Force, he did not know what would have happened. But what was wanted from the Air Force was a plane which would land in any weather on any ground, and take off "from a threepenny bit." A third difficulty was fatigue and stress of the pilots. Group-Captain Wells had rather suggested that the work of piloting the wounded was less trying than ordinary air fighting, but Colonel Roch's experience was that these young pilots were full of zeal and ardour when it was a question of bombing places, but the responsibility of carrying wounded affected them more than might have been anticipated. The time arrived, indeed, when the aeroplanes were used only for the most serious cases, simply on account of the wear and tear experienced by these gallant pilots.

VISITS TO ALDERSHOT AND PORTSMOUTH.

The discussion was over in time to permit of the members journeying to Aldershot, which they did by char-a-banc. On arrival, they were separated into parties, and visited various places of interest, including the R.A.M.C. training centre, the Cambridge Hospital, the dental clinic, the Army School of Hygiene, the R.A.S.C. formations, as well as barracks, regimental institutes, and the supply and transport organizations. After tea they witnessed, on the central sports ground, a gymnastic display by members of the Army School of Physical Training. On returning to London they were the guests at a conversazione at the Royal College of Physicians and a reception at the Royal College of Surgeons.

The whole of Wednesday was devoted to a visit to Portsmouth, where the visitors were guests of the Lord Mayor and Corporation at the Guildhall, and of the officers at the Royal Naval Barracks. H.M.S. *Victory* and H.M.S. *Hood* were visited, as well as the Royal Naval Hospital, Haslar, and the submarine depot at Fort Blockhouse.

RECEPTIONS.

A conversazione in honour of the delegates was held on the evening of Tuesday, May 7th, at the Royal College of Physicians. The guests were received in the Library by the President, Sir John Rose Bradford, and Lady Bradford. In one of the upper rooms an interesting exhibition had been arranged of portraits and books in the possession of the College illustrative of naval and military medicine. An attractive programme of music was provided by musicians from the band of H.M. Welsh Guards.

There was also an evening reception on May 7th at the Royal College of Surgeons, where the President, Lord Moynihan, and Lady Moynihan welcomed the delegates and their friends. Sir Arthur Keith, conservator of the museum, gave an epidiascope demonstration in the lecture theatre of various museum specimens illustrating design in nature. The army medical war collection was a centre of attraction, and many Hunterian relics, portraits, and other objects of interest were displayed. A portion of the Royal Artillery band rendered a selection of music during the evening.

A report of the later proceedings of the Congress, which included discussions on tropical fevers, wounds of blood vessels, and the standard of physical fitness, will appear in the next issue.

British Medical Journal.

SATURDAY, MAY 11TH, 1929.

CHRONIC DEAFNESS.

THE progress of aural surgery in the treatment of middle-ear suppuration, with its attendant labyrinthine, intravenous, and intracranial complications, has been so remarkable that it has perhaps obscured the claims upon the otologist of those who are only deaf. The discussion held last week by the Section of Otology of the Royal Society of Medicine on the subject of chronic deafness had the merit of showing what has been done for the alleviation and cure of this disability, and of taking stock of the methods at present adopted for its prevention and treatment. There can be no doubt that the success of preventive measures—for example, the removal of adenoids in early life, or the prompt treatment of middle-ear suppuration, which nowadays is only rarely allowed to become chronic—has received less credit than it deserves. While, however, there are substantially fewer deaf persons haunting the out-patient clinics and the consulting rooms of otologists, their number is still a standing reproach to modern aural surgery.

Without entering into a detailed classification of pathological types of deafness, it may be said briefly that changes in the middle ear, disease of the cochlea or of the auditory nerve, and that mysterious disorder otosclerosis, account for practically all cases. It has been contended that study of the pathology of deafness has resulted in nothing but a therapeutic nihilism, nearly everything that has been done for its practical relief having originated in mere empiricism. This statement, while it is unduly sweeping, and certainly unjust to those who have scientifically studied the morbid anatomy of the ear, contains some truth, and accounts for the number and variety of the methods of treatment recommended. Their very number, admittedly the product of a commendable activity in the otological microcosm, is evidence of the inefficiency of each method individually. It is conceded on all sides that the basic and well-established treatment of chronic deafness is the removal of septic tonsils, whose presence is often overlooked, the drainage of any focus of infection in the nose, and inflation of the tympanum by the Eustachian catheter or the method of Politzer. When these measures have failed, as they often do, the otologist still finds himself confronted with the maze of remedies which have been tried and discarded and then revived again, and also with some newer methods still on trial. Thus there are those who still employ inflations of vapour into the tympanum, massage, and ionization. Recently massive intravenous doses of colloidal iodine have been tried, but as they may well cause obliteration of veins the method is unlikely to come into general use. Diathermy has given benefit, and has been found to relieve the tinnitus aurium which is so often a distressing concomitant of deafness. Ultra-violet light has naturally been given a trial, and the apparatus of Zund-Bourguet is still in active use. Dr. Cathcart claimed at last week's meeting that of 623 patients treated by this apparatus 396 (63 per cent.) were improved, but it is impossible to say how many (and this is true of the claims made on behalf of most forms of treatment) were cases of functional deafness. The hard of hearing become inattentive; if they do not listen they do not hear, and they develop an epiphenomenon, a functional deafness, "the malady of not marking." The most satisfactory report came from Mr. Eric Watson-Williams, who has found that some patients with otosclerosis, which has an ill-defined but generally accepted relation to calcium metabolism, are benefited, even cured, by extract of parathyroid gland in large doses. There is one form of treatment—namely, operation on the middle ear—which seems to have been abandoned definitely and permanently. This method has had a fair trial, but on the whole without good result. The difficulty of obtaining a sterile field of operation entails the risk of provoking a middle-ear suppuration, with all the attendant consequences and possibilities, and little is now heard of stapedectomy and intratympanic tenotomies.

Behind all this, however, as the president (Mr. Somerville Hastings) wisely observed, lies the fundamental difficulty of testing the hearing efficiently. It frequently happens that the patient is pleased with treatment, and says he hears better, although tests of hearing show no improvement. The opposite also is true: the patient may show an improvement to hearing tests without obtaining any subjective benefit. We may conclude that, although a great deal can be done for deafness and tinnitus even to-day, it is not likely that much advance will be achieved by methods founded on empiricism. There must first be developed more satisfactory methods of testing the power of hearing and estimating its changes, and new methods of treatment must be established on a rational pathological basis. It may be gratifying to produce a subjective increase of hearing and diminution of tinnitus, but this by itself should no longer satisfy the modern student of otology with a scientific training. The introduction of new and better methods of treatment will entail much laborious research, both clinical and pathological.

THE PARLIAMENT OF 1924–29.

THE sixth Parliament of the reign of King George V ended this week after a busy life of four and a half years. The dissolution might legally have been postponed till the autumn, but poor attendances in both Houses, perfunctory debates, and the mortality among members of the House of Commons had shown during late months that the present Parliament was exhausted. Whatever the political complexion of the Parliament to be elected on May 30th, it will contain many new members, some of them probably women, though it is noteworthy that the extension of the franchise to women over 21 has not been followed by the nomination of more than a few scores of women candidates. Practically all the medical men in the late Parliament will offer themselves for re-election. The extension of the franchise to millions of women electors, giving them a numerical superiority over men in almost every constituency, is generally regarded as the chief work of the Parliament now closed, but constitutional authorities will attach equal importance to the events of 1926, when the Government withstood and broke the general strike, and of 1927, when Parliament passed the Trade Disputes and Trade Unions Act, by which general strikes were made illegal and civil servants were forbidden to be members of external associations with political objects. The events of these two years cut deeply into the time available for normal legislation, and in view of the loss of revenue during 1926 the Treasury was necessarily hesitant in approving schemes for the extension of social services.

The reduction of the State contributions to national health insurance, carried on the proposal of the Chancellor of the Exchequer, has, according to his critics, restricted the granting of additional medical and other benefits by approved societies.

Despite these preoccupations, and difficulties over time and money, the legislative output has been high, particularly in bills bearing on medical subjects and the public health. This Parliament's interest in the public health found expression even at its close in the many questions on the purchase of radium for medical purposes and on the reports of the Interdepartmental Committee on Mental Deficiency. The Parliamentary Medical Committee, comprising medical M.P.'s and university members, influenced opinion and guided policy both in the Ministry and in the Opposition parties. In the House of Lords Lord Dawson of Penn, lately joined by Lord Moynihan, has presented the point of view of the profession, notably on the Local Government Bill, in speeches of conspicuous ability. Non-medical members, too, who were fortunate in obtaining good places in the ballot, rendered useful service by introducing bills on public health subjects; several such bills were helped in the later stages by the Government, and have become law. Nevertheless, the chief credit for the large and valuable output of public health legislation introduced during the period under review rests with the Minister of Health, Mr. Neville Chamberlain, the Parliamentary Secretary of his department, Sir Kingsley Wood, and the Under Secretary for Scotland, Dr. Walter Elliot. During his period of office Mr. Chamberlain has brought a comprehensive legislative scheme to a successful issue. Mr. Churchill, by providing pensions for widows and orphans and by giving insured workers pensions at 65, reduced the calls upon the old Poor Law. Mr. Chamberlain then took powers to supersede certain boards of guardians, standardized valuation, and, with the aid of Mr. Churchill, altered the basis of local rating. He codified the Poor Law, including its public health provisions, and in 1925 secured the passage of a Public Health Act, giving local authorities larger powers to deal with infectious disease. The passage of the Local Government Act abolished elected boards of guardians, and converted county councils and county borough councils into the chief public health authorities entrusted with the administration of the Poor Law, and allowed them to deal under the relevant statutes with many matters relating to the public health. Under the terms of this Act workhouses, infirmaries, and other public institutions revert to the new public health authorities, whose duty it will be to reclassify them and to secure their best use according to schemes which must be submitted to the Ministry. Mr. Chamberlain hopes that by this reclassification much accommodation will become available for the use of the sick and of mental defectives. A similar Act has been passed for Scotland. Only during the closing stages of these bills in the House of Lords were their medical aspects discussed, and then largely through the insistence of Lord Dawson, who directed the attention of Parliament and of the country to the manner in which they might weaken the voluntary hospital system.

The administration of the Ministry of Health during the past four and a half years has ensured steady building of houses with public assistance, though slum clearance is only now being placed in the front of the Government's programme. Great progress has been made in schemes for the promotion of maternal and child welfare; and the Government has denied the suggestion, expressed in the course of debate, that the new block grant system introduced under the Local Government Bill will check the extension of this work. All parties have now pledged themselves to make special efforts to reduce maternal mortality, and Mr. Chamberlain has lately told the House that investigations conducted by general practitioners of the country under the auspices of the British Medical Association had already contributed to this end.

Other measures of medical interest passed during this Parliament include the Housing (Scotland) Act, the Criminal Justice Act, the Lead Paint Act, the Births and Deaths Registration Act, the Smoke Abatement Act, the Coroners Act, the Nursing Homes Registration Act, the Midwives and Maternity Homes Act, the Midwives and Maternity Homes (Scotland) Act, the Mental Deficiency Act, the Food and Drugs Adulteration Act, the Medical and Dentists Acts (Amendment) Act (confirming an agreement with the Irish Free State over the *Medical Register*), and the National Health Insurance Act, 1928, which authorizes specialist medical advice and surgical treatment as additional benefits. The control and compulsory notification of venereal disease was raised in a bill which failed to pass the House of Commons. This, the Edinburgh Corporation Bill, aroused very strong feelings in the House, and showed that few M.P.'s are willing to accept medical opinion when they think it conflicts with the liberty of the subject.

THE NATIONAL RADIUM FUND.

It is gratifying to note that the National Radium Fund, for which an appeal had been launched in the *Times* of April 29th, was already over-subscribed on May 6th. We explained last week (p. 820) that the appeal for £150,000, the amount required for the National Radium Fund, was being made conjointly with a special appeal by King Edward's Hospital Fund in aid of the hospitals in the metropolitan area, as a thank-offering for the King's recovery, the latter project having for its nucleus the 100,000 guineas offered by an anonymous donor. The treasurer of the combined appeal is Lord Donoughmore, and its two branches, sharing a common office organization, have been administered throughout in the closest co-operation. Lord Donoughmore, in a letter to the press dated May 4th, has indicated that, the money required for the National Radium Fund having been subscribed, all connected with King Edward's Hospital Fund would wish that the needs of hospitals outside the metropolitan area should be more directly associated with the Thank-offering Fund. While the desire of donors outside London to help their own hospitals could be met by the opening of local funds, he suggests that if they prefer to send contributions to the offices of the Thank-offering Fund, at 103, Kingsway, W.C.2, ear-marked wholly or partly for hospitals in which they are particularly interested, care will be taken that their gifts are allocated in accordance with their wishes. In a letter to the *Times*, published on May 2nd, the Prime Minister expressed, on behalf of His Majesty's Government, the deep gratification with which they had seen the swift and spontaneous response of the public to the opportunity of manifesting its relief at the lifting of the shadow which lay over the country during the King's illness. With the £154,779 already in the National Radium Fund, and the Government's contribution of £100,000, practical steps could be taken to bring the benefit of radium treatment to many who would otherwise have waited for it in vain. The Prime Minister suggested that the people could best complete their thanksgiving in its outward and visible aspect by contributing, as far as lay in their power, to the continued maintenance and prosperity of the voluntary hospitals of the country.

LEPROSY OUTSIDE THE BRITISH EMPIRE.

THE increasing number of references to leprosy in these columns recently will have made it clear to our readers how greatly the old pessimism with regard to this disease has been modified by the improved methods of treatment which have been introduced. A short note on the position as regards the British Empire appeared on March 30th (p. 612), and the story of the campaign against leprosy may be conveniently amplified now by a reference to what is occurring in foreign countries. In previous years the League of Red Cross Societies published a monthly review entitled *The World's Health*; this periodical is now issued quarterly, and its issue covering the first three months of 1929 illustrates one advantage of this change—namely, that reports can now be grouped, the topic in the present instance being leprosy. Describing the position of leprosy in Japan, Dr. Rokuro Takano mentions that the country is now divided into five areas, each of which has its own sanatorium. A national sanatorium has been built on an island situated off the west coast, and in addition to these sanatoriums there are a number of small institutions, but most of the lepers in Japan remain in their homes. A scheme to create a leper settlement in a suitable district is receiving the careful consideration of the Government, which will have to provide part of the funds for its maintenance in view of the fact that the majority of lepers are destitute. A movement is on foot to organize a national prophylaxis institute with the aim of hastening the enlargement and improvement of existing hospitals and directing a campaign against the disease. Investigations in November, 1925, showed that there were over 15,000 lepers in Japan, the disease being more than twice as common among men as among women. While a certain number of cases may have been overlooked, it is believed that leprosy is decreasing definitely in Japan. Prince Vallabhakara, who is director of the Health Section of the Siamese Red Cross Society, mentions that a clinic and an asylum have been established in and near the capital. We have previously referred to the valuable work in Southern Siam of the American Presbyterian Mission, and to what is being done by the British and American Missions for Lepers at Chiengmai in Northern Siam (*Journal*, June 23rd, 1928, p. 1071). Importance is attached to establishing better co-ordination between the various agencies operating against leprosy in a country where it is admitted that a large number of lepers are under no control of any kind. Professor Jorge Bejarano, in a brief note on the energetic attempt made in the Republic of Colombia to deal with leprosy within its frontiers, states that three settlements have been established and are doing well. He considers that the disease is undoubtedly brought into his country from Europe, and that the number of lepers in Colombia is far less than is generally thought. The management of the leper settlements is entrusted to a director-general, who is responsible to the Ministry of Education and the Ministry of Public Health. The high incidence of leprosy in Mexico was mentioned in a note in the *Journal* on January 26th (p. 165). Leprosy in Central and Southern Europe is the subject of the second of a series of communications by the Rev. J. E. Abbott in the April issue of *Leprosy Notes*, the quarterly periodical of the British Empire Leprosy Relief Association; he reports the conclusions reached after a tour made with a view to gaining first-hand knowledge of this matter. No evidence was discovered of leprosy in Poland, Austria, Czechoslovakia, or Hungary, but it is present in Jugoslavia, Italy, and in Switzerland where it was once endemic. There is one small leper colony in the south of Sardinia, and it is hoped to provide more facilities for clinical treatment and segregation in other parts of Italy. Mr. Abbott attributes this freedom of Central Europe to the fact that none of the countries concerned have colonies in lands infested with leprosy, nor have they any special connexion with such lands. He believes that South America furnishes Europe with a large number of her lepers. The position in this respect in Bulgaria, Greece, and Albania is unknown, but the author estimates that there are at least 1,600 lepers in Central and Southern Europe. In the same issue of *Leprosy Notes* there is an article on leprosy in the Dutch East Indies, by Lieut.-Commissioner Palmer of the International Headquarters of the Salvation Army. He reports that the Dutch East Indian Government is energetically coping with the disease, and that the lepers are coming for treatment in increasing numbers. It is hoped to build a large leper hospital in Batavia, and all possible help is given by the Dutch Government to the various leper colonies under the care of voluntary societies. Finally, it may be remarked that in the April issue of *Without the Camp*, the quarterly magazine of the Mission to Lepers, interesting short notes will be found on the present position in Japan, China, Korea, and the Federated Malay States.

POISON GAS IN WARFARE.

ON April 30th, at the session of the Preparatory Commission for Disarmament Conference held at Geneva, Lord Cushendun announced that, subject to certain reservations, the British Government had decided to ratify the Geneva pact of 1925 against the use of asphyxiating and poison gas and bacterial weapons in warfare. The reservations were to the effect that His Majesty's Government would be bound only in relation to those other States who had ratified the protocol and adhered thereto, and would cease to be bound by the protocol in relation to any enemy States whose armed forces or whose allies did not respect it. Lord Cushendun added that he made this announcement, at their request, also on behalf of the Governments of Australia, New Zealand, South Africa, and the Irish Free State, and his statement was followed by one from the Canadian delegate, Dr. Riddell, who said that his Government also had decided to ratify the protocol subject to the same reservations concerning reciprocity. The protocol in question binds the contracting parties, so far as they are not already bound by other treaties prohibiting the use of asphyxiating, poisonous, or other gases, and of all analogous liquid, materials, or devices, to accept such prohibition, and to extend it to the use of bacterial methods of warfare. It comes into force for each State from the moment its ratification is deposited. This protocol is to be welcomed as an instrument of propaganda against the use of inhumane methods in warfare. It gives some expression to the revolt of civilized persons against methods of warfare that, by their nature, cannot discriminate between soldiers and non-combatants. It makes articulate a common sentiment which may become powerful enough, even when war is actually in progress, to hinder the efforts of those persons who naturally would tend to use the most lethal weapons at their command. The weakness of this protocol, as of all similar pacts, is that arrangements made dispassionately in peace time generally have little power to bind in time of war. During the great war ships were sunk without notice and the transit of food destined for the civilian population was interfered with, though both these acts were contrary to international law. In this connexion we may recall that the use of asphyxiating gases in warfare had already been prohibited by the Hague pact of 1907, to which the majority of powers were parties. It may be noted that there is nothing in the protocol to prevent a signatory from using poison gas and bacterial methods as a reprisal, and it may be questioned whether modern warfare can be conducted even for a single day

without creating what may be interpreted as occasions for reprisals. A rumour, a false report even, that the enemy is using inhumane methods of waging war may become a pretext for regarding the provisions of the protocol as no longer binding.

MAKING THE MOST OF SUNSHINE.

WHATEVER may be the outcome of the controversy about artificial sunlight, it will be agreed that the natural variety is better, and it ought to be a national endeavour to make the most of it. The antirachitic virtues of sunlight are due to certain of the ultra-violet rays, but actually there is only a very narrow zone of effective solar rays, and the intensity of this portion of the spectrum falls off very rapidly. This rapid falling off is due to absorption by the earth's atmosphere, and has been attributed to ozone in the outer limits, and to smoke, dust, and moisture in the lower layers. A marked seasonal variation in the prevalence of rickets has long been recognized, and this can be correlated with a seasonal variation in the antirachitic value of natural sunshine. The question as to what produces this variation has been studied for some years, and in a recent paper[1] Drs. F. F. Tisdall and Alan Brown of Toronto discuss the altitude of the sun in relation to its antirachitic effect. They used for their experiments rats fed on a diet calculated to produce rickets, and the animals were exposed daily to the sun's rays during the spring and autumn of 1927 and the spring of 1928. The time of day during which the animals were exposed, the duration of the exposure, and the exact altitude of the sun in Toronto at the time of the experiments, were ascertained. In the course of the experiments, which were somewhat complicated because of the difficulty of obtaining exposures at the various altitudes of the sun which were being investigated, it became obvious that a marked increase in the antirachitic effect of sunshine occurred when the sun reached an altitude of about 35 degrees in the spring, and a decrease occurred at a corresponding time in the autumn. It was ascertained also that the spring sunshine was slightly more effective than the autumn sunshine, and the morning sunshine was more effective than that of the afternoon. These results are believed to be due not so much to the fact that the shorter rays get through at increased altitudes of the sun, but rather that there is an increased intensity of the effective zone of ultra-violet light. These experiments are interesting in view of the geographical distribution of rickets. In certain parts of the world where the disease is unknown, or at the worst occurs in a very mild degree, the minimum seasonal altitude of the sun is only slightly less than 35 degrees. In London, on the other hand, the minimum altitude is 16, and is below 35 for five months of the year; and although the amount of antirachitic rays required is probably smaller with children than with rats fed on rickets-producing diets, yet a study of the altitude of the sun gives a very good idea of the prevalence of this disease in certain parts of the world and at certain seasons of the year. The practical results of these experiments are concerned with the exposure of infants to the sun. During the hot summer months it is considered inadvisable in Toronto to expose infants to the heat of the sun at midday, and a consideration of the time of day at which the sun reaches an altitude of 35 degrees indicates that infants may be placed outside at any time from 8 and 8.30 in the morning to 4 and 4.30 in the afternoon during the summer months. Similar times can, of course, be calculated for any other place, and it is important that such calculations should be made if the best use of natural sunlight for curing rickets is to be obtained. These studies are concerned only with rickets principally because experiments in this disease are comparatively easy, but it is obvious that to make the most of sunlight a great deal of further knowledge on similar lines for other disorders is necessary.

THE ROYAL ACADEMY, 1929.

IT seems to be agreed that the 161st exhibition of the Royal Academy is one of the best all-round displays of contemporary art that have been seen in recent years. Though there are few works of outstanding importance, much of the material is very good of its kind, and the arrangement of the pictures is happier than usual. Black-and-white work at last receives due recognition at Burlington House, water colours are better represented and better shown, and the corresponding decrease in the number of oil paintings is, if anything, a gain to the exhibition as a whole. Medical art connoisseurs who intend to visit this year's Academy will not need assistance from us in finding their way about the galleries, and our purpose here is merely to name some of the exhibits that have direct interest for members of our profession as such. Among these must first be mentioned the lifelike portrait, by Richard Jack, R.A., of Lord Moynihan in the scarlet and gold and purple robe worn on ceremonial occasions by the President of the Royal College of Surgeons of England. Equally unmistakable is the painting by Sir William Orpen, R.A., of the Minister of Health, Mr. Neville Chamberlain, against a crimson background, though this cannot compare with the same artist's wonderful portrait of Sir Ray Lankester—a masterpiece if ever we have seen one. Professor Priestley Smith is the subject of a quiet canvas by Harold Speed, and there are two other straightforward medical portraits in oils—one of Dr. Barbara Sprott, by G. Spencer Watson, A.R.A., and the other of Mrs. J. H. Macdonald, M.D., by Maud Hall Neale. In the black-and-white gallery will be found an etching by Edmund J. Sullivan of Sir StClair Thomson in doctor's gown and wearing the presidential badge and chain of the Royal Society of Medicine. The crowded sculpture in the Lecture Room include a marble bust by Sir Goscombe John, R.A., of the late Sir Charles Brown, to be placed in the Royal Infirmary, Preston, and another, by Albert Toft, of Dr. A. S. Woodwark; both are well executed. There is also a miniature of Dr. Charles Miller in the South Room, and this completes our list of medical portraits. Among the medals exhibited by the Royal Mint is the member's badge for this week's Congress of Military Medicine and Pharmacy, designed by T. H. Paget. As for the architectural room, this contains many drawings of new hospital buildings, welfare centres, clinics, convalescent homes, and research institutes. Lastly, those in search of pathological specimens will find in Gallery VIII a clear case of facial paralysis, dwarfs in abundance, and a striking representation of cachexia in a young woman.

HEALTH AND WELFARE OF MERCHANT SEAMEN.

A NATIONAL conference on the health and welfare of the British merchant navy at home and in ports overseas was held in London on May 3rd. It was organized by the British Social Hygiene Council and the British Council for the Welfare of the Mercantile Marine (the latter a body which has recently come into existence for the purpose of providing recreational facilities for merchant seamen). The Marquess of Linlithgow presided over a representative gathering, in which Dr. H. G. Dain and the Medical Secretary represented the British Medical Association. Mr. H. B. Butler of the International Labour Office, who made a statement on the international position, mentioned that the health insurance of seamen was one of the subjects which would come before the next International Labour

Conference at Genova in October; he hoped that an international agreement would be reached parallel to that which was embodied in the convention already existing dealing with workers on shore. Sir John Sandeman Allen, M.P., described the general conditions in home ports from the point of view of the moral welfare of the seaman, and Dr. R. M. F. Picken, medical officer of health for Cardiff, reported on the subject of venereal diseases. Dr. Picken said that no definite information was available as to the extent of venereal disease in the community, and no special knowledge about its incidence among the seafaring population. Records showed that the amount of venereal disease coming to the clinics was diminishing so far as syphilis was concerned, and probably also with respect to soft chancre, but there was no diminution in the number of gonorrhœa patients. Cardiff was one of the few places which had a special hospital for seafaring men with a clinic for venereal disease attached. The amount of venereal disease treated at that clinic diminished from 1921 to 1926, but since then it had increased. This must not be taken to mean that venereal disease in general was increasing; it was simply a reflection of the amount of trade at the port. Although venereal disease might be declining to a certain extent among the seafaring population, there was still a great deal of it, much of which did not come up for treatment at all. From some further figures which Dr. Picken gave it appeared that nearly one-third of the men attending the clinic he had mentioned were infected in home ports; nearly 15 per cent. in France; 10 per cent. in Spain and Portugal; and nearly 10 per cent. in South American ports. As to facilities for treatment, there had been organized through the Ministry of Health a system of interchange of information between ports, so that men might receive treatment under more or less scientific conditions at the various places of call. This, however, did not meet all the requirements, and the most important matter of all in relation to treatment was that the medical profession itself should discover methods which did not have to be continued for such long periods. After further discussion a series of resolutions was adopted; one of them welcomed the proposals of the International Labour Organization to consider the terms of an international convention for the health insurance of seafarers, and another called for the establishment of port welfare committees in major ports to stimulate and co-ordinate the activities for providing recreation and decent accommodation.

ROCKEFELLER MEDICAL FELLOWSHIPS.

THE Rockefeller Medical Fellowships for the academic year 1929–30 will shortly be awarded by the Medical Research Council, and applications should be lodged with the Council not later than June 1st. These Fellowships are provided from a fund with which the Medical Research Council has been entrusted by the Rockefeller Foundation. Fellowships are awarded by the Council, in accordance with the desire of the Foundation, to graduates who have had some training in research work in the primary sciences of medicine or in clinical medicine or surgery, and are likely to profit by a period of work at a university or other chosen centre in the United States before taking up positions for higher teaching or research in the British Isles. In special circumstances the Fellowships may be tenable at centres of research not in America. A Fellowship held in America will have the value of not less than £350 a year for a single Fellow, with extra allowance for a married Fellow, payable monthly in advance. Travelling expenses and some other allowances will be paid in addition. Full particulars and forms of application are obtainable from the Secretary, Medical Research Council, 38, Old Queen Street, Westminster, S.W.1.

DARWIN'S HOME.

THE president and officers of the British Association for the Advancement of Science have issued invitations to a garden party on the afternoon of Friday, June 7th, on the occasion of the opening of Down House, the home of Charles Darwin, which Mr. G. Buckston Browne, F.R.C.S., has presented to the association in custody for the nation. Mr. Buckston Browne has fully restored the whole house and brought back the ground floor as far as possible to its condition in Darwin's time. Thanks to a number of donors, this floor now contains many objects actually used by Darwin or appropriate to his period. At the opening ceremony on June 7th the chair will be taken by Sir William Bragg, president of the British Association, and the house will be declared open by Sir Arthur Keith, ex-president.

DR. W. H. CRAGO.

THE gold medal of the Branches of the British Medical Association in Australia is to be formally presented to Dr. W. H. Crago at the inaugural meeting of the third session of the Australasian Medical Congress (British Medical Association) on September 2nd. Dr. Crago joined the Association in 1884. He was elected a member of the council of the New South Wales Branch five years later, and held the position of honorary treasurer from 1889 to 1893, when he became vice-president. In the next year he held the post of president of the Branch, and from 1895 to the present time he has been honorary treasurer. Among the many services rendered by Dr. Crago to medical progress in Australia may be mentioned his supervision of the publication of the *Australasian Medical Gazette* from 1895 to 1914. He was also chairman of the directors of the Australian Medical Publishing Company, Ltd., from its creation in 1913 until 1924.

AMONG those upon whom the University of Cambridge will confer honorary degrees at a special congregation on Tuesday, June 4th, is the Poet Laureate, Dr. Robert Bridges, F.R.C.P.

THE Chadwick Trustees announce that the Malcolm Morris Memorial Lecture by Sir Norman Walker, M.D., on "The Progress of Dermatology over Fifty Years," will be given in the Hall of the Royal Society of Arts, John Street, Adelphi, on Thursday next, May 16th, at 5.15 o'clock; Sir StClair Thomson, M.D., will preside. The date of the last Chadwick Lecture of the spring programme (an open-air lecture, weather permitting, in the Chelsea Physic Garden) has been changed to Friday, May 31st, when Mr. H. V. Taylor, commissioner of horticulture to the Ministry of Agriculture, will discuss supplies from the vegetable kingdom and the public health.

THE spring number of the *Bristol Medico-Chirurgical Journal*—of which Professor J. A. Nixon is editor—includes a practical note on the care and treatment of mental defectives, by Dr. H. L. Ormerod, and an article of topical interest by the assistant editor, Dr. Carey F. Coombs, on the distal phenomena accompanying high arterial tension. Mr. H. S. Souttar's address on radium and its surgical applications, which was recently published in our columns, is reprinted by permission. Other clinical articles are: the rôle of pyelography in renal disorders, by Mr. A. Wilfred Adams; and a case of rectal prolapse, reported by Dr. D. Robertson and Mr. D. G. C. Tasker. Reviews of books, and reports of the meetings of the Bristol Medico-Chirurgical Society and the Clinical Society of Bath, are other features of an interesting number of a live medical publication which reflects credit on its producers.

CONCERNING MATERNAL MORTALITY IN CHILDBIRTH.

BY

SIR HENRY SIMSON, K.C.V.O., M.B., C.M.,
F.R.C.P.LOND., F.R.C.S.ED.,
OBSTETRIC SURGEON TO THE WEST LONDON HOSPITAL.

MUCH that has been said and written recently concerning maternal mortality in childbirth points to a general dissatisfaction with the manner in which parturient women are looked after. To ascertain where the blame for the admittedly unsatisfactory state of affairs lies it is necessary to consider the part played in obstetric practice by four separate groups of people—namely: (1) the general public, from whom parturient women are derived; (2) those who teach obstetrics; (3) those who practise obstetrics; and (4) the public health authorities and the Ministry of Health.

THE GENERAL PUBLIC.

What in the past has been the attitude of mind of the general public towards childbirth? I do not think anyone will quarrel with the statement that the vast majority of the general public look upon childbirth and the rearing of children as the natural occupation of women, and upon the act of childbirth as a natural process which must of necessity be normal. From these premisses the conclusion has been derived that Nature is the best obstetrician, and that the only help a parturient woman requires can be quite satisfactorily obtained from some other woman who has "gone through" with it herself, preferably on a sufficient number of occasions to be able to show a quiverful and to refer to the obsequies of several others. This attitude of mind might be justified in the case of a multipara who has three or four normal confinements to her credit, but to apply it to a primipara is absolutely unjustifiable—in fact, one might almost call it criminally negligent. It assumes that during the 274 days of pregnancy which precede labour the great obstetrician Nature is quite capable of looking after an expectant mother, and that as a parturient woman may expect to go "twice round the clock" before she delivers herself, it is quite unnecessary to send for assistance until she has exhausted herself in her efforts to overcome a difficulty which could quite certainly have been rectified had assistance been obtained earlier. By earlier I mean not only earlier in labour, but earlier in pregnancy—nay, even before pergnancy had begun.

Not very long ago, a rickety dwarf was admitted to one of my beds in hospital for repair of an extensive laceration of the perineum extending two or three inches into the rectum. She had received no ante-natal supervision whatever, and the doctor was not sent for until she had been in labour for over twenty-four hours. When finally he did arrive the child was dead, and a craniotomy had to be performed.

Had that woman been seen by any doctor any time after she had reached maturity, she would have been told that she would have to be delivered by Caesarean section, the pelvic deformity being so obvious. The general public must be made to realize that Nature is by no means a good obstetrician, especially in first confinements: that competent supervision during the 274 days of pregnancy which precede labour is infinitely more important than supervision during the early stages of labour: and that when the question of obtaining medical assistance during the later stages of labour arises the words "once round the clock" must be substituted for "twice round the clock."

THOSE WHO TEACH OBSTETRICS.

Obstetrics is taught to medical students by obstetric specialists on hospital staffs; to midwives it is taught by obstetric specialists, but to a greater extent by the matron and sisters of lying-in hospitals. Both these sets of teachers find it impossible to reproduce the conditions in which the majority of their pupils will eventually have to work. They therefore start their task of imparting clinical obstetric knowledge with an almost overwhelming handicap, and it is a matter of great regret that the lot of the teachers of medical students is very much worse than that of the teachers of midwives.

The regulations of the Central Midwives Board with regard to the training of midwives are excellent. Every midwife is compelled to call in medical assistance in all cases where the presentation is not an uncomplicated vertex or breech; I do not propose to offer any criticism on this point beyond saying that it is not always easy to assert that a given vertex or breech is uncomplicated. The special curriculum in obstetrics required for a medical student is quite another matter. Take, for example, that required for the Conjoint Board: all teachers and examiners in obstetrics are agreed that it is inadequate, but the time of medical students is so fully occupied with other work that it is practically impossible to extend the obstetric curriculum. It is not this, however, that handicaps the teaching of obstetrics. Consider the position of the resident obstetric surgeon of a lying-in hospital. He finds himself responsible for the welfare of a large number of expectant mothers in his district. He knows that when these women go into labour they will be attended by inexperienced nurses, some of whom are still undergoing their training, and by undergraduates whose knowledge of clinical obstetrics is negligible. He therefore impresses on his pupils that there is never any occasion to hurry in the early stages of a confinement; that most confinements may end naturally (which, however, is not to say normally); that in the event of assistance being required the less examination the patient has been subjected to the better; and that at the first visit all that is necessary is to ascertain that the woman is in labour and that the presentation is a vertex. Both of these points, he teaches, can be determined by abdominal palpation, and by abdominal palpation only. The making of a digital vaginal examination is considered to be extremely dangerous, and in certain quarters a rectal examination is advocated as a lesser risk. The whole of his teaching is based upon the policy of "wait and see"; but unless he is a superman he gives his pupils clearly to understand that if he is routed out of bed unnecessarily it will not be to their advantage. In this policy he is amply justified, because he knows that if anything goes wrong and he is sent for, he has at his back an ambulance service, a fully equipped lying-in hospital with a sterilizing department to supply him with a sterile obstetric outfit, a labour ward, an operating theatre, and a specialist to help him should a major obstetric operation be necessary. Last, but not least, he has an ante-natal department, where all abnormalities are detected and admitted to the hospital. The unfortunate result is that the pupils rarely see an abnormal case on the district, and are only shown how to manage difficult labours in ideal surroundings.

Can such instruction be translated into private practice? Consider what may happen if the practitioner fails to hurry when rung up to go to a confinement. The usual answer to the question "When will the baby arrive?" is "You must expect to go twice round the clock." At the end of twelve hours the answer to the same question may be "Confinements are often very slow—please don't worry." But at the end of twenty hours the statement that "a specialist should see the patient" will probably be met by the question "What will his fee be?" When at last the consultant arrives he finds that he has to do his work in most unsuitable surroundings, unless the patient can afford to go to a nursing home, and even then there is no ambulance service available for her removal.

There is, therefore, no doubt that before a newly qualified medical practitioner can conscientiously attend a confinement in private practice he must find some opportunity for post-graduate instruction. One would go so far as to say that it is the duty of all medical practitioners who propose to attend confinements to obtain this additional training and knowledge.

THOSE WHO ATTEND CONFINEMENTS.

Midwives chiefly attend people who are unable to afford to engage a doctor as well, and I can think of no one more suitable to attend a normal confinement than a fully qualified competent midwife. In quite a large number of cases she

is actually on the spot before the patient has started labour. Once labour has started she is able to give up the whole of her time to her patient until the labour is finished, and she is in constant attendance on her patient for the first ten days of the puerperium. To prevent her doing more than to "wait and see" she is only allowed to take with her to a confinement an appliance for giving a vaginal douche, an appliance for giving an enema, a pair of scissors, a clinical thermometer, and a nailbrush; and the moment she finds herself in any difficulty she is expected—nay, even compelled—to send for medical assistance.

This is where her troubles begin. If she is lucky she has a doctor whose post-graduate training has given him a considerable knowledge of obstetrics; if she is unlucky she may call one with less experience and training, but who none the less has a qualification which allows him to use morphine, hyoscine, chloral, pituitary, chloroform, rubber gloves, axis-traction forceps, perforators, cranioclasts, intrauterine douches, and goodness knows what besides.

Now there are a small number of medical practitioners who specialize in obstetrics. What this really means is that these men have devoted a considerable amount of time to the post-graduate study of clinical obstetrics, that they are prepared to limit their work to obstetrics and gynaecology, and that when attending a confinement they are ready (at an adequate remuneration, of course) to give up their time to a personal supervision of the case, provided a fully trained maternity nurse is engaged and the patient is in suitable surroundings. Also, before undertaking to attend a case, they insist that they must be given a free hand with regard to ante-natal observation. In the confinements attended by these men the number of women who are allowed to go twice round the clock and deliver themselves unaided is non-existent. Statistics can, of course, prove anything, and can also be explained away, but I know of a nursing home which took in 147 confinements in one year, of which 95 cases were complicated and 52 terminated in natural delivery. The complicated cases comprised 29 Caesarean sections, 16 inductions, of which 5 demanded the use of forceps as well, and 50 forceps deliveries. All the natural deliveries had chloroform, and most of them had some form of morphine and hyoscine in the early stages of labour. All that these figures show, however, is that Nature is not always to be relied upon in dealing with a pregnant woman.

In addition to the specialists there is a very much larger number of medical practitioners who combine obstetrics with their general practice. They do their obstetric work in less favourable circumstances than the specialists. They find it difficult to persuade their patients that ante-natal supervision is so important, and in a busy general practice it is sometimes difficult to find the time to carry out this supervision adequately. Once a patient goes into labour it is often impossible to neglect the rest of the practice until the labour is over. Can it be wondered, then, that many of these eminently competent practitioners intensely dislike the obstetric part of their work? The general public do not grumble if the family doctor refuses to remove their tonsils, extract their teeth, or ligature their piles—but if he does not attend confinements they go elsewhere. One notices with interest and with satisfaction that all over the country the tendency is towards the formation of small groups or firms of medical men, each with his own special part in the practice, but each prepared and thoroughly competent to carry out the ordinary work of any of his partners. Should a woman go into labour the partner whose job it is feels himself at liberty to devote as much time as is necessary to the case, secure in the knowledge that the rest of his work is being looked after by his colleagues.

I feel certain that on lines like these is to be solved the problem of the care of pregnant women belonging to the class which can afford to have the attention of a doctor and a maternity nurse. But at a conservative estimate only about 25 per cent. of labours in the country are attended by the two classes of medical men just referred to. The other 75 per cent. are among women who cannot afford to have both a doctor and a trained maternity nurse. These women either bespeak the services of a doctor—without, however, expecting much attendance from him unless anything goes wrong—and have a handywoman to "see them through," or they engage a midwife. Now I maintain that the ultimate responsibility for adequate attendance on these women rests with the Ministry of Health under the Insurance Act, or with the public health authorities. Under the Insurance Act what is called a maternity benefit is given to an insured woman or to the wife of an insured man. This benefit takes the form of a sum of money, which is paid out, as a rule, through an approved society after the confinement, and covers a period of four weeks from the confinement. The Act makes no stipulation as to how this sum of money is to be expended, and no provision for ante-natal observation, but by giving the grant the framers of the Act have definitely assumed that they are to some extent responsible for the welfare of its recipients.

In a good many of the London boroughs the public health authorities have opened ante-natal clinics and maternity beds for poor patients, but these clinics do not definitely co-operate either with the Ministry of Health or with medical practitioners in the borough, the attendance of expectant mothers is entirely voluntary, and no provision is made for the conduct of labour in the women's own homes. There are, furthermore, 847 infant welfare and ante-natal clinics scattered throughout the country. These are philanthropic institutions which make us proud of our country; at present these centres receive money grants in aid of their work from the Ministry or public health authorities. The actual results of these various attempts to deal with the situation are not altogether encouraging. In illustration I would cite the following case.

> A primipara engaged a midwife, but did not think of going to see her until a week before the baby was expected. The midwife, finding that the patient was suffering from headache and swollen ankles, advised her to see a doctor. The patient went to an ante-natal clinic, where it was found that the urine was loaded with albumin, and she was most strongly urged to go at once to a hospital. She went home to consult with her husband and mother, and did not act on the advice given to her at the ante-natal clinic. The next that was heard of her was when she had had two eclamptic fits. Everything possible was done, but the woman died.

Now all the persons concerned in this case did all that was expected of them, but as no one was actually responsible no treatment was actively undertaken until too late. Proper co-ordination between the midwife, a medical practitioner, the ante-natal clinic, and a hospital would have prevented the catastrophe.

It would not be difficult to cite other cases, but the outstanding features of them all have been the same: an absence of any organized co-operation between the various parties concerned; some abnormality in labour which, owing to the accepted "wait and see" policy, was not diagnosed until too late to be rectified easily; some form of internal examination or operation which necessitated the introduction of the hand into the uterus, or the use of instruments; and an exhausted patient with an exhausted uterine muscle which was incapable of dealing with the third stage of labour adequately.

I have still to be convinced that digital vaginal examination is a source of danger to a woman in labour. I am prepared to argue that anyone who has not sufficient surgical knowledge to make such an examination in a surgically clean manner has no business to attend a confinement. Cases of puerperal infection have been reported where no examination of any kind has been made. If one takes into consideration the surroundings in which so many confinements take place, the only wonder is that serious intrauterine sepsis is not more prevalent than it is. That a subacute puerperal infection is extremely common has been abundantly proved by the work of Dr. Remington Hobbs, but at present we are only concerned with the maternal death rate, of which 80 per cent. is due to some form of sepsis. The history of the cases of severe puerperal sepsis in which I have been consulted have a number of features in common: a long labour, probably a primipara, an exhausted patient, and an exhausted uterus, possibly an instrumental delivery, certainly a third stage with a retained placenta or post-partum haemorrhage; and then has gone in more than the index finger in circumstances and surroundings which court disaster.

FINAL CONCLUSIONS.

I have been forced to the conclusion that, in primiparae at any rate, a normal labour—that is, a labour completely free from abnormality—is not a common occurrence. In the normal labour of a primipara the head should be engaged a week before labour starts, and the membranes should not rupture until the os is fully dilated; yet at least 50 per cent. of first confinements occur without the fulfilment of one or other or both of these conditions. If, however, the head does not engage until uterine contraction begins, and, as frequently happens, an enema has not been administered within an hour of the commencement of labour, the loaded sigmoid prevents the occiput from descending readily. In consequence the head enters the brim slightly extended, and the occipito-bregmatic diameter takes the place of the suboccipito-bregmatic. This causes very definite delay in anterior rotation and abnormally long first and second stages. If, moreover, extension takes place while the head is crowning, the extra half-inch of the engaged diameter causes a tear of the perineum. When the second condition is not fulfilled the anterior lip of the cervix tends to get pushed downwards in front of the occiput. This not only causes severe pain to the woman, but increases enormously the strain on the cervico-pubic portion of the fascial support of the anterior wall of the vagina. The best treatment is to push up the anterior lip during three or four consecutive pains by digital pressure, but owing to the fetish against vaginal examination the condition is neither diagnosed nor treated. The result is unnecessary and prolonged pain for the patient at the time, and in a very large number of cases a definite rupture of the cervico-pubic fascia. How often this occurs one realizes on recalling the number of women who, after they get up from a confinement, complain of bladder trouble and even slight incontinence of urine, especially on coughing. This rupture of the anterior fascia is the first stage of a subsequent prolapse, and there is no doubt in my mind that unnecessary prolongation of the first stage of labour, with the undue strain on the pelvic floor which it entails, has more to do with the production of prolapse than anything else. The remedy is to preach the doctrine of surgical cleanliness, and so to allow of an early diagnosis of a difficulty to be made while time remains to rectify that difficulty easily.

It would take too long to enter into details as to how the proposed co-ordination between the Ministry of Health, the public health authorities, the welfare centres, and the practitioner can be effected; but one thing leaps to the imagination: the Ministry of Health grants a cash maternity benefit. It is surely within its powers to make the payment of this benefit dependent on proof of adequate ante-natal observation. This certificate of observation could be obtained from the patient's medical attendant, an ante-natal clinic run by the public health authorities, a welfare centre, or a lying-in hospital. I am certain that many general practitioners who attend expectant mothers would welcome co-operation with the clinics and centres. Pregnant women would soon realize that they must get in touch with a doctor or a midwife early in pregnancy. Many doctors, knowing that the clinic was not run in opposition, would be glad to be relieved of the work of ante-natal supervision. During pregnancy they would remain in charge of the patient's general health, and the moment any special symptoms showed themselves, being in touch with the ante-natal clinic, they would be in a position to co-operate immediately to the best advantage of the patient.

With regard to the actual attendance at the confinement, a midwife or a maternity nurse would always be in attendance in the early stages, and it would be simply a matter of arrangement between the parties concerned whether she would send for the medical practitioner or to the ante-natal clinic as soon as she began to suspect some abnormality. It should also be possible for midwives and general practitioners to obtain sterilized obstetric outfits from the clinics and centres.

That some scheme such as this is within the range of practical politics is proved by the fact that the Ministry of Health has already taken over the treatment of venereal disease throughout the country among the same class of patient which would be looked after by this suggestion. But the general public, like the ostrich with his head in the sand, is a curious bird. As long as a danger is not absolutely obvious it is difficult to get people to realize that preventive measures are infinitely better than measures for treating bad results. The person suffering from syphilis is an obvious danger to the community; but the parturient woman does not obtrude herself in the community until she dies—and then it is too late.

PARATYPHOID FEVER IN LONDON.

REPORT ON THE 1928 OUTBREAK.

THE outbreak of paratyphoid fever which occurred in London and several of the Home Counties during the end of July, 1928, and continued throughout August, gave rise, it will be remembered, to a considerable agitation in the press and in certain interested quarters, in favour of altering the law relating to the use of preservatives in food. In a leading article (August 18th, p. 316) discussing the outbreak we expressed the opinion that "there would be no additional security to the public against outbreaks of this character were a 'minute quantity of boric acid' permitted to be added to cream as a preservative. It is not in the public interest that an outbreak of infectious disease calling for calm and experienced investigation should be made the subject of a newspaper stunt, and exploited to revive a practice which has been abolished in America and in regard to which, as the result of careful, prolonged, and skilled inquiry, official prohibition has tardily followed in this country." Confirmation of this opinion is now given in the report of his investigation presented by Dr. J. A. H. Brincker to the medical officer of health to the London County Council, and published this week.[1]

Etiology and Incidence.

The report opens with a general discussion of the etiology of typhoid and paratyphoid fevers, and of the peculiarities exhibited by the outbreak in question. Dr. Brincker points out that whereas cases of illness exhibiting prostration, continued fever, and abdominal symptoms were till comparatively recently all notified as typhoid, or continued fever, the use of bacteriological methods has made it possible to allocate the majority of such cases into the categories to which they belong—namely, typhoid fever and paratyphoid A, B, and C. The micro-organisms of these diseases, with certain kindred pathogenic organisms, such as Aertryke's and Morgan's bacillus, which are associated with outbreaks of food poisoning, are responsible for the Salmonella group of diseases, which all result from the ingestion of appropriately contaminated food or drink.

During the war there was some expectation that *B. paratyphosus* A, B, and C, together with Aertryeke's and Morgan's bacillus, hitherto comparatively uncommon in this country, might be brought into it by troops who had contracted and recovered from the corresponding diseases in countries where they are normally endemic; this expectation has not been fulfilled. What higher incidence of paratyphoid there has been in London since the war may be due to the better methods of diagnosis and the wider recognition of the disease as a separate entity; on the other hand, the infrequency of the post-war outbreaks demonstrates that modern sanitation, increased vigilance on the part of sanitary authorities, and possibly the absence of conditions that favour the spread of the disease, have combined to keep the risks in check. Apart from occasional outbreaks, usually traceable to a specific cause—namely, infected food—efficient supervision and control of foodstuffs, milk and water supplies, shellfish beds, and so on, has limited the occurrence of enteric fever to sporadic cases.

A comparison of the notifications and deaths from enteric fever in London during the ten years preceding the war with those for the ten post-war years illustrates not only that the fears of a greater prevalence of enteric fever following demobilization were not realized, but that the disease has considerably declined. Thus, in 1905, there were

[1] Outbreak of Paratyphoid Fever. Report by the Medical Officer, London County Council. No. 2643. Price 1s.

1,552 cases, with 234 deaths; in 1914 there were 789 cases, with 147 deaths. In the post-war period the disease had so declined that in 1919 there were only 342 cases, with 59 deaths, and in 1927 there were 322 cases, with 27 deaths. During the three months ending September 29th, 1928, however, no fewer than 338 enteric or continued fever notifications were received in London, 230 being notified as paratyphoid fever. If the date of onset be taken into account there were 282 patients, of whom 201 were cases of paratyphoid B, who developed their illness during the period July 1st to September 1st, the great majority during the third and fourth weeks in July. In Surrey there were 203 notifications, in Middlesex 63, in Kent 38, and in Hertfordshire 21, during the same period. Most of these cases also developed about the third or fourth week in July. A comparison of these figures with those showing the normal incidence of the enteric group of diseases during the years 1919 to 1927 made it clear to the authorities that they were faced with an outbreak which could not be explained by normal conditions.

History of the 1928 Outbreak.

On July 30th five cases of paratyphoid fever, serologically diagnosed as paratyphoid B, occurred in a children's nursery in Streatham. On the following day fifteen cases, mostly among well-to-do persons, occurred in Kensington. Inquiries made by the public health authorities elicited reports of other cases in Fulham, Westminster, and various other western London boroughs. Simultaneously the Ministry of Health drew attention to an outbreak in Surrey, about which it was established that most of the patients had partaken of cream from one common source —namely, "X's" large wholesale dairy. The following day particulars of additional cases were received from other outlying districts, and practically in them all cream supplied by "X" was inculpated.

Source of Infection.

As the inquiry proceeded it became increasingly evident that practically the only common factor in the cases investigated was the consumption of cream from "X's" dairy. In his early investigations Dr. Williamson, medical officer of health for Epsom, made the significant discovery that the cream received from "X" on July 7th by certain retailers was bad on the following day, in spite of having been kept in a refrigerator overnight, and that customers had complained about it. It was also brought to light by a study of the dates of onset of the illness that in practically all the cases the patients were actually infected on or about the week-end July 7th–8th. From Carshalton, Leatherhead, Dorking, Beddington and Wallington, Sutton and the Maldens, from Kensington, Fulham, Wandsworth, and Paddington, the reports were essentially the same: a majority of paratyphoid B cases reported were definitely known to have consumed cream derived from "X." This weight of evidence notwithstanding, an investigation was made of other possible sources of infection. No evidence could be found implicating water supplies, contaminated foods, and attendance at baths—all factors usually associated with outbreaks of this kind.

Investigation of "X's" Creamery.

Immediately "X's" creamery came under suspicion, inquiries were made to ascertain the source or sources from which his supplies were derived, the methods of handling and distributing the cream, and the means employed for sterilization. "X," it was found, receives his supplies of cream from Ireland, Holland, and an English company. The cream from Ireland is said to be pasteurized at the place of origin, but "X" has always found it necessary to re-pasteurize it immediately upon its receipt in London. Examination of samples of this cream as received by "X" showed it to be grossly contaminated with *B. coli*. The Dutch cream is sterilized in Holland at 200° F., and exported in sealed tins. On analysis it was found to be quite satisfactory and above suspicion. The English cream is pasteurized before delivery to "X," but samples taken from time to time on "X's" premises were found to be contaminated with *B. coli*. The Ministry of Health was unable to discover anything suspicious about the milk from which the English cream is derived, or about the health of the employees handling it. Careful inquiry into the medical history of these employees and of their families yielded no evidence to show that any one of them could have acted as a focus of infection. The method of pasteurization was, however, open to objection, and the Ministry suggested improvements in the technique employed. While, then, there is strong presumptive evidence from the data available that cream supplied by "X" was responsible for the outbreak, actual proof is lacking owing to the failure to discover paratyphoid organisms in the samples of cream taken every three weeks after the infection occurred. It may be assumed, however, that the infection was probably of a transitory character, such as would be produced by an intermittent carrier.

It is noteworthy that not until July 25th, 1928, did "X" begin to pasteurize the English cream. Before that date, however, it had been regularly supplied by the English firm every Friday to its employees, and no case of paratyphoid fever was discovered to have occurred among them. Furthermore, certain seaside towns were supplied by "X" with this cream during the week-end July 7th–8th; yet no cases of paratyphoid fever were reported from these towns. The amount of cream diverted to the employees and the seaside towns amounted to about half of the total supply of one day; the remainder was used by "X" for mixing with Irish and Dutch cream. Had the cream from this source been infected it would have been expected that cases of paratyphoid would occur among the persons in the seaside towns and the employees who consumed unmixed cream. The fact that the Irish cream was grossly contaminated with *B. coli* indicates that at some stage of its production or in transit it must have been exposed to pollution. Whether it was actually infected with *B. paratyphosus B* will now never be known, but if such were the case the only explanation that can be offered is that it may have inadvertently slipped through the cordon of precautions during a rush period, when there was an abnormal demand for cream.

Boric Compounds as Preservatives in Cream.

In view of the press criticisms of the ban against the use of boric acid as a preservative in food, Dr. Brincker devotes a portion of his report to a discussion of the existing food preservative regulations. Boric acid in food, he points out, is intended merely as a preservative, not as a germicide; while inhibiting the growth and activity of putrefying organisms it does not kill them. It has no action on the germs of disease. In the past it has been used as a preservative in cream in a 0.25 per cent. concentration; it has been proved, however, that cream with as much as 4 per cent. boric acid will contain vigorously growing bacteria, even after thirty-six hours. The tendency in some quarters to rely upon preservatives to mask the signs of early decomposition in food is in itself a potent reason against their free use. Proper care in the preparation and handling of food to minimize the risk of contamination, and, where applicable, pasteurization or sterilization, must be regarded as the basis of all wisely directed measures for safeguarding the food of the people.

ROYAL MEDICAL BENEVOLENT FUND.

DURING the first quarter of this year £2,774 has been voted in grants and £1,320 paid to annuitants, showing an increase on the corresponding period of last year. As the fund expands in usefulness so is further support and the need of enlisting new subscribers the more urgent. Subscriptions and donations should be sent to the Honorary Treasurer, 11, Chandos Street, Cavendish Square, London, W.1.

At the recent meeting of the committee thirty-three grants were made, amounting to £715 2s. The following are short notes on four of the cases helped.

M.D., aged 76, whose sight had been damaged by x-rays in the early days of long exposures. Vision of the right eye practically gone, and left eye failing. Applicant was one of the earliest pioneers of radiology in this country. Private income £22. Freemasons have given a pension of £64, making a total income of £86. Voted £30.

M.B., C.M., aged 72. For many years has suffered from mitral valvular disease; during the last few months has had increasing difficulty in walking, and cannot work. His savings are exhausted. Voted £40.

Widow, aged 62, whose husband was a ship surgeon until his death in February, 1929. She has been left with no income. Her daughter is earning £130 a year, and relations contribute £50. Voted £35.

Daughter, aged 61, of M.R.C.S. Her father died when applicant was a child. She was trained as a nurse and supported herself through life as nurse matron in schools. In 1928 a severe operation compelled her to give up work. Income £75; rent £25. Voted £25.

VITAL STATISTICS FOR ENGLAND AND WALES.

THE REGISTRAR-GENERAL'S REVIEW.

THE Registrar-General's Statistical Review of England and Wales would at first sight appear to be a no more dramatic document than any other report of annual stocktaking. Through the masses of statistical tables, however, and within the graphs, the discerning mind may perceive a coherent picture of the social structure and of the trend of events on which any just forecast must be founded. Changes in birth rates and in death rates, in the incidence of disease and in the expectation of life, in the age distribution of population and in the marriage rate—these, as much as the results of a cultural or an economic survey, must determine an appreciation of the nature and the progress of a civilization.

1927 and its Forerunners.

The review for 1927,[1] just published, opens with an account of the deaths registered in England and Wales during that period, of which 246,606 occurred among males and 233,003 among females. The total of 484,609 corresponds to a rate of 12.3 per 1,000 of estimated population, or, standardized to correct for the deviation of the age and sex distribution of the population, to 10.6. In 1926 the standard rate was 10.1, and in 1925 10.3; but apart from these two years no other has ever returned so low a rate as that for 1927. After a period of practical stability from 1841 to 1880, and until the end of the nineteenth century, the age constitution of the English population gradually became more favourable to longevity, in consequence of the fall in the birth rate dating from 1877. This had the effect of decreasing the proportion in the age group 0–5, for which the mortality is now almost exactly double the average for all ages, though in the last century the excess was much greater. During the present century, however, other influences have come into play, chiefly reduction of mortality in later life, which, by greatly increasing the proportions living at ages over 55, have interrupted the tendency to low mortality. Since the enumeration of the standard population in 1901, the proportions of persons per million of all ages in the age groups under 20 are lower now than at any preceding census, and at all over 45 they are higher. This increase has resulted both from the large decline of mortality at most ages over 45, and from the fact that persons over 45 are survivors from a period when population was being more rapidly recruited by new births than at present. The increased death rate in 1927 was determined by the mortality in the March quarter (in which there were more deaths than in any corresponding period since the great influenza epidemic), all the other three quarters returning rates which are among the lowest yet recorded. The tendency for the male death rate to increase as compared with the female is revealed by the fact that for the third year in succession there is male excess in each age group of population. In the middle of the last century mortality was steadily higher for females than for males of 25 to 35; at that time tuberculosis was more fatal to females at this age, whereas from 1871–80 onwards its mortality has been greater for males.

Infant Mortality.

The rate of infant mortality in 1927 was 70 per 1,000 live births, the lowest yet recorded in this country with one exception—69 in 1923. Of the 484,609 deaths registered during the year, 45,610, or 9.4 per cent., were those of infants under 1 year of age; this proportion, which as recently as 1901–10 was 22.6 per cent., has fallen greatly of late years, owing mainly to reduction of the birth rate. During the last forty years of the nineteenth century infant mortality was almost stationary; the fall in this century, represented in England and Wales by a halving of the rate, has occurred throughout Europe and the civilized world generally, being accompanied elsewhere, as here, by a fall in the birth rate, which may go far to account for it. The mortality rates for the county boroughs and for the North were, as usual, in considerable excess, the highest rate being 87 for the northern county boroughs, and the lowest 49 for the urban and rural districts of the South. The general tendency has been for the reductions to be greatest in the South and smallest in Wales, and whereas the advantage of the South over the North has tended to increase, that of the country over towns has diminished. Particularly noteworthy are the figures recorded for London; usually its mortality is high in early infancy and tends to some excess later on, especially at 3 to 6 months; but in 1927 the London rate was below that for England and Wales at all ages, except for a 4 per cent. excess at 3 to 6 months. The regional differences are of a surprisingly constant nature, and indicate that in England a southern environment is more favourable to life, even from the day of birth, than a northern.

The excess mortality of males over females, which has greatly increased along with and in consequence of the fall in infant mortality during the present century, was 31 per cent. in 1927. In each recorded age period up to 1 year the death rate was considerably greater—at certain periods twice as great—among illegitimate than among legitimate infants. Changes in the recorded causes of mortality are largely attributable to increased caution in diagnosis, particularly of conditions formerly classified as convulsions, debility, and tuberculosis, and to the substitution of more definite forms of return. The only causes of appreciably increased mortality are influenza and congenital defects, the rate from the former being attributable to the prevalence of fatal influenza in the first three months, from the latter to the increasing incidence of malformations, which in the year under review accounted for a mortality of 4.77 per 1,000 live births, the highest rate yet recorded.

Causes of Death.

Causes of death are classified in this review in the form adopted by the Registrar-General in consultation with the Ministry of Health for use in 1921–30, and are related to the international lists as revised by the commission which met for the purpose at Paris in 1920. The low mortality from enteric fever, the incidence of which was somewhat higher in 1927 than in several previous years, is attributable to the unprecedentedly low fatality rate of 104 per 1,000 notified cases. Scarlet fever and diphtheria yielded lower fatality rates in 1927 than in any other year since 1911, when publication of the notifications was begun. In general, the small-pox prevalent during the year conformed to the mild type, but the report of the Chief Medical Officer records cases of severer types in certain local outbreaks in London and Middlesex. The deaths from measles numbered 3,622, corresponding to a mortality of 92 per million of population; the rate was thus lower than for any previous year, except 1921 (59) and 1926 (89). The statistical tables show how preponderantly measles mortality is affected by city life. The regular increase shown for 1927 from rural districts to small towns, and from these to county boroughs, is common to the experience of each of the years 1911–27, for which the facts are available. For twelve years in succession the rate of mortality from scarlet fever has been much lower than any recorded previous to this period (1916), the rate for 1927 being less than 2 per cent. of that prevalent sixty years ago. Deaths from whooping-cough have been falling rapidly during the present century, the rate for 1927—94 per million total population—being less than half that for 1906–10. The 2,732 deaths from diphtheria included 1,339 of males and 1,393 of females; this excess of females is a constant feature of the returns, applying to each year since the disease was first distinguished, except 1922. The rate—257 per million aged 0–15—was lower than in any previous year except 1923–24, and less than one-fifth of the maximum rates during the years 1856–65.

The mortality from influenza—567 per million persons living—was the highest crude rate recorded since the great epidemic of 1918–19, though the standardized rate was exceeded by the similar rate for 1922. The effect of standardization in reducing the crude death rate from influenza—a disease chiefly fatal to old people—has been increasing along with the proportion of old people in the population since the standard year, 1901. During the great epidemic of 1918–19, age for a time ceased to favour mortality, but since then the proportion both of the population and of influenza deaths has increased at the higher ages. Mortality from influenza with pneumonic complications has been in considerable excess for males, and that with other pulmonary and without stated complications in some excess for females. Of the deaths in 1927, 45 per cent. were stated to have been associated with pneumonia, and 24 per cent. with other complications. The highest mortality was in the first quarter of

[1] The Registrar-General's Statistical Review of England and Wales for the year 1927. (New Annual Series, No. 7.) H.M. Stationery Office. 1929. Price 5s. net.

the year, culminating in February, when 42 per cent. of the year's deaths occurred.

The mortality from encephalitis lethargica, 29 per million, though lower than during 1924-26, was higher than for any previous year since 1918, when these deaths were first distinguished. The notifications were also higher than for any year previous to 1924. The standardized death rate from tuberculosis increased from 942 per million in 1926 to 952, its proportion to that from all causes falling, however, from 9.3 to 9.0 per cent. It is probable that the share in the total mortality attributed to tuberculosis has never been so low in any previous year. The small increase of tuberculosis mortality in 1927 was attributed to the outbreak of influenza in the first quarter of the year, a causal association which is confirmed by similar comparison for other recent years. The mortality ascribed to syphilis, after falling steadily from a maximum for recent years of 60 per million in 1917 to 30 in 1925, rose again to 32 in 1926 and to 36 in 1927. The infant death rate from this cause has, however, continued to fall, and it seems probable that the recorded adult increase may be attributed to the use in the second half of 1927 of the new form of death certificate, in which the attention of the certifying practitioner is directed to the remoter antecedents of the immediate cause of death.

The deaths ascribed to cancer—25,048 for males and 29,030 for females—are the highest yet recorded. The standardized death rate for males, 1,018 per million, is higher than for any previous year except 1925, but the rate for females, 984 per million, is below that for the years 1924-26 and 1913. During the last century the standardized rate for each sex increased steadily and to practically the same extent for each sex, the excess for 1896-1900 over 1851-55 being 488 per million for males and 483 for females. But this equality of increase implied a reduction of the proportionate excess for females from 114 to 32 per cent. After 1900 the rate of increase slackened greatly, but less for males than for females, with the result that by 1924 addition of a further 311 per million to the rate for males, as against only 74 to that for females, has placed the former for the first time in excess of the latter, an excess which has been maintained in each of the three subsequent years.

The standardized death rates from diabetes—in 1927, 88 for males and 101 for females—were higher than in 1926, the rate for males being the highest since 1923, and for females since 1915. The increase has occurred entirely at the highest ages, and if it is desired to trace the effect of insulin on mortality it is necessary to deal with the various periods of life separately. The figures show that whereas for all ages under 55 an obvious improvement has occurred, its effect on the total mortality has for males been almost, and for females more than, wiped out by the extraordinary increase in the diabetes death rate at greater ages. The death rate from pernicious anaemia is of interest because of the introduction of liver treatment in 1927. Though it is too early to form a definite conclusion from the figures available, the fact that the highest reduction of mortality occurred in the fourth quarter of the year, after attention had been called to the new treatment in the third, would seem to offer hopeful prospects for the future.

The number of deaths allocated to heart disease—33,365 of males and 38,744 of females—was, as usual, higher than for any other of the scheduled causes of death. The increasing age of the population and the change in certification contributed to the large increase in the crude mortality from heart disease in 1927, but two most significant factors were the influenza epidemic in the first three months of the year and the introduction of the new form of death certificate in July. It is probable that more than half of the increase may be attributed to influenza.

The death rate assigned to pregnancy or childbirth was 4.11 per 1,000 live births, inclusion of deaths associated with pregnancy and childbirth raising the figure to 5.43. The increased associated mortality was due partly to the prevalence of influenza, partly to the increasing tendency to record, without necessarily implicating, recent childbirth on certificates of death from other causes. Especially noteworthy in 1927 was the fact that the puerperal mortality in London from both septic and other causes was the lowest in the country. In rural districts the rate of mortality from sepsis was for the first time greater than that for all England and Wales, and the highest recorded since the epidemic of 1920.

The total number of deaths under or connected with the administration of anaesthetics was 596, thus exceeding that for 1926 by 40, and being more than double that of any year prior to 1916, except 1914 (300). The increase has occurred notwithstanding the very general substitution of ether for chloroform, the latter having been associated with over four-fifths of the deaths at the beginning of the century, but with less than one-fifth in 1927. The record of ethyl chloride, stovaine, and novocain on death certificates is increasing rapidly. Unfortunately, the deaths associated with each type of anaesthetic cannot be collated with the number of administrations, and it is not even possible to say whether the rapid increase in the number of deaths implies increased mortality under anaesthetics. No record is available of the number of administrations, and the deaths tabulated are those which occurred under, not those caused by, anaesthesia. It is possible that the increase of this type of death may be partly dependent upon increased boldness in operative surgery.

Population.

The total population of England and Wales as at June 30th, 1927, has been estimated at 18,804,000 males and 20,486,000 females. The population is assumed to have grown by 3.7 per cent. over the period since 1921, representing an arithmetical average of 0.61 per cent. per annum, as compared with 0.49 per cent. per annum during the decade 1911-21. The sex inequality expressed in 1921 as 1,096 females per 1,000 males has been reduced to 1,089 females per 1,000 males at the present time. The average ages of the mid-1927 population were 30.9 and 32.4 for males and females respectively, as compared with 29.9 and 31.2 at the last census. 654,172 live births were registered during 1927, corresponding to a birth rate of 16.6 per 1,000 of population. This rate is the lowest on record, not even excepting that of the war years, during which it was unusually depressed. Having regard to current economic and industrial conditions, the rate appears likely for some time to remain low in relation to the rates that obtained at all earlier periods for which we have reliable records. The proportion of male to female births was 1,041, 1,051, and 1,042 to 1,000 for legitimate, illegitimate, and total births respectively. From 1919 the male excess has fallen almost continuously, the ratio now approaching that of the years immediately preceding the war. The excess of live births over deaths was 169,563, as compared with 240,759 in 1926; this drop in the natural increase figure is attributable to the conjunction of the decrease in births with the increase in deaths. The population as a whole is gradually getting older, owing to the heavy falls which have occurred during the past half-century both in fertility and mortality. The older sections, where the death frequencies are naturally highest, are becoming relatively more numerous, and if the true underlying mortality remains unchanged the crude death rate must continue to encroach on the already diminished margin of natural decrease. The encroachment would be delayed by a real decrease in mortality or an increase in fertility. Of the advent of the latter there is no evidence at all; while as regards the former, from the very nature of the case the lower mortality falls the less room is there for it to fall still further. The inference must be that with a continuation of present conditions the further growth of population will tend to take place at an ever-diminishing rate up to a stage at which births and deaths are equal, the latter thereafter gaining the ascendancy, with a consequent decline in population.

SMALL-POX CASES FROM THE "TUSCANIA."

REPORT BY THE M.O.H. FOR GLASGOW.

THE following report, supplied by Dr. A. S. M. Macgregor, medical officer of health for Glasgow, deals with the circumstances attending the recent introduction of small-pox from India by the s.s. *Tuscania* between April 5th and 22nd. Fifteen cases of small-pox were removed to hospital in Glasgow subsequent to the arrival of the vessel on April 4th, thirteen being members of the crew, one a passenger, and one a relative of a steward, who conveyed the infection presumably by means of his clothing. All were directly due to infection received on or, in one case, transmitted from the ship. Contemporaneously with this occurrence others of the ship's complement, both passengers and crew, became ill shortly after reaching their destinations in various parts of the country and abroad.

Movements and Personnel of the Vessel.

The ship arrived at Bombay on March 4th and left on March 14th, the ports of call on the homeward journey being as follows: Port Said and Suez, March 22nd; Marseilles, March 27th; Gibraltar, March 29th; Liverpool, April 1st; and Glasgow, on the evening of April 4th. She left Bombay with a total complement of 1,117 passengers and an all-British crew of 437 members, taking on 19 passengers at Port Said, 8 at Marseilles, and 9 at Gibraltar. There disembarked 21 passengers at Suez, 14 at Port Said, 457 at Marseilles, 10 at Gibraltar, and 651 at Liverpool. Of the crew, 176 were paid off at Liverpool. The vessel arrived at Glasgow with a crew of 288 and 8 remaining passengers. A supply of lymph sufficient to vaccinate, if need be, the whole personnel of the ship had been taken on board before leaving this country. Notices offering revaccination were posted up on the vessel at Bombay, but without effect.

Incidence of Small-pox on the Vessel.

On April 3rd a message was received from the port medical officer at Liverpool that the ship had had small-pox on board, that a case had been landed at Liverpool, and that the date of onset was March 18th. This was followed by a list of the crew and passengers proceeding to Glasgow, either on shipboard or by rail. On arriving at the boarding station at Greenock it was ascertained by the port medical officer that a case of small-pox had been removed at Marseilles in the following circumstances, as reported by the ship surgeon.

The patient, a seaman, had been taken ill on March 17th, and had been removed to the ship's hospital on the following day, where he remained until admitted to hospital at Marseilles. His symptoms were headache, fever, and a severe tonsillitis, followed on March 20th by an erythematous rash, developing next day into what appeared to be a marked general dermatitis, going on to the formation of large blisters on various parts of the body, with considerable prostration. The patient was given antidiphtherial serum, and the condition did not suggest small-pox. The ship surgeon pointed out that he was fortified in this diagnosis by the opinion of the boarding medical officers at Port Said, Suez, and Marseilles, and by two other medical men on board. It was only after the ship had disembarked its passengers and had left Marseilles that the diagnosis of small-pox was communicated to the ship by a wireless message. Revaccination of the ship's personnel was then commenced and completed by April 1st, when the ship reached Liverpool.

This patient was treated throughout in the ship's general hospital, and even although he was ultimately recognized to be suffering from small-pox it seems most unlikely that this source of infection could have been responsible for the widespread infection of the passengers and crew, which apparently took place about this time. His immediate contacts, a passenger and a member of the crew, both of whom were under treatment in the hospital, along with the hospital attendant, were removed to Liverpool for observation, and none of them have developed the disease.

The second patient on board ship, a greaser, who was removed at Liverpool, became ill on March 18th, and was treated throughout in the isolation hospital as a case of chicken-pox.

The ship surgeon states that this man was also seen by the boarding officers at Port Said, Suez, and Marseilles, but no other diagnosis was made.

Procedure at Glasgow.

On arrival at Glasgow on April 4th a general inspection of the crew and the remaining passengers revealed no case of small-pox on board, and arrangements were made to maintain strict daily supervision over the passengers and members of the crew, whether remaining on the ship or proceeding to their homes. This procedure is in accordance with general practice and with Article 42 of the International Sanitary Convention, 1926. At the same time, appropriate arrangements were made for disinfection of the ship's hospitals. This was the position when the vessel arrived, and on the basis of the facts as ascertained, there was no reason to anticipate the events which followed, especially as the two small-pox patients on board, although undiagnosed, had been isolated in the ship's hospitals, and were most unlikely to have caused a widespread general infection of the personnel of the ship. Even had there existed power to place a vessel in quarantine, it is extremely doubtful whether the facts disclosed on the arrival of the ship would have justified so serious a measure of precaution.

As regards notification of the destination of contacts for the purpose of surveillance to the local authorities concerned, it appeared that this had been carried out at Liverpool in so far as related to those passengers and crew who had disembarked there. There was, however, no indication that passengers who left the ship at Marseilles, and proceeded overland to various parts of this country and abroad, had been similarly reported. It was, indeed, ascertained that among this group were several passengers proceeding to Glasgow, in respect of whom no notification of contact had been received. Accordingly, a list of the names and addresses of the 457 passengers via Marseilles was obtained from the shipping company and notified to the appropriate authorities in various parts of this country and the Continent. These passengers had disembarked on March 27th, and by the time these lists had been obtained and the names and addresses forwarded to the proper quarter, the information would arrive just about the time that contacts might be expected to sicken of small-pox. Had the voyage been still further prolonged the delay would have been still greater. As it was, this measure was late enough, especially as many of the passengers were moving about on holiday.

This raises a very important point as to the procedure for effecting adequate surveillance of contacts disembarking from a ship on which small-pox has occurred. It should clearly have been the duty of some person or authority to perform this function as soon as the first case landed at Marseilles was definitely diagnosed. It was not undertaken till the port of final destination had been reached. As soon as it was apparent that small-pox was occurring among the ship's complement an effort was made, without success, to obtain the names and destinations of the ten passengers who disembarked at Gibraltar.

Incidence of Small-pox among the Contacts.

On April 5th, the day after the arrival of the ship, the first case of small-pox declared itself in a bedroom waiter, who was removed on suspicion, and definitely diagnosed next day to be suffering from small-pox with a sparse eruption. On April 6th three other cases were discovered in a linen keeper, who had been isolated on the previous day in the reception house for observation, an engineer, and a first-class steward. There then followed, during subsequent days, a series of further cases among the crew, making a total of thirteen.

On the ship's arrival, and for one or two days later, a number of the crew were affected with catarrhal conditions resembling a very mild influenza, no doubt due to their return from the tropics to a cold climate. Owing to the difficulty of separating these from possible early cases of small-pox a number were admitted to the reception house for observation. Two of this group were found to be developing small-pox. This complication was, however, evanescent, and as a routine procedure during the subsequent period of observation and contact showing indisposition, however mild, was removed to the reception house. For these purposes, 27 members of the crew were thus dealt with, of whom 6 actually developed small-pox. The immediate contacts of the cases who took ill at home were also accommodated in the reception house. The thirteen members of the crew admitted to hospital with small-pox were as under:

Case.	Rating.	Sickened.	Rash.	Isolated.	Remarks.
J. S.	Waiter	April 1	April 5	April 6	Sparse eruption.
E. B.	Linen keeper	,, 3	,, 6	,, 5	Abundant semiconfluent.
A. M.	Engineer	,, 4	,, 6	,, 6	Abundant semiconfluent.
D. M.	Waiter	—	,, 6	,, 8	Scanty eruption. No history of sickening.
J. F.	Engineer	April 5	,, 7	,, 7	Severe confluent eruption.
R. M.	Waiter	,, 5	,, 7	,, 7	Scanty eruption.
J. M.	Steward	,, 5	,, 7	,, 6	Scanty eruption.
P. M.	Waiter	,, 7	,, 9	,, 9	Abundant eruption.
A. C.	Trimmer	—	,, 11	,, 11	Abundant eruption.
J. M.	Waiter	?	,, 8	,, 11	Sparse eruption.
J. P.	Trimmer	April 7	,, 9	,, 8	Sparse eruption.
M. M.	Seaman	,, 8	,, 11	,, 10	Sparse eruption.
J. C.	Steward	—	,, 12	,, 14	Very sparse eruption. No history of sickening.

To this list there must be added three other patients, two of whom were directly related to infection on or from the ship, and a third whose origin has not been satisfactorily explained.

A passenger, who had left the ship at Liverpool, and, after spending a few days in London, had proceeded to Glasgow on a visit, was detected with a discrete small-pox eruption by a medical practitioner whom he had consulted shortly after arrival on April 9th.

This man had travelled from the South by motor car to a town near Glasgow, and after being shaved in a local barber's shop in Uddingston had traversed the city in several tramcars and buses, with a fully developed eruption. The itinerary followed during this journey was ascertained in detail, and published in the press, with a recommendation that any person who might have travelled on these vehicles at the time specified should take the precaution of being vaccinated. The date of appearance of this man's eruption was approximately April 8th.

There occurred also an indirect case of infection in the person of a sister of a steward who had proceeded to his home in Glasgow on April 4th, taking with him his kit, which was sorted out and washed a day or two later by the patient, who was taken ill on April 18th, the rash developing on April 20th. This man, who remained well under close observation and who presented no evidence of a recent infection, had, however, been in close contact with one of the cases on board ship. He had developed an abscess on an arm, which was lanced by the surgeon, and, being off duty, had been detailed one night to look after the ship's hospital, and had personally attended to the patient who was removed at Marseilles on March 27th. His sister was infected within a day or two of his arrival home, the contagion being conveyed probably through the medium of his clothing or the dressings of his wound, a quite likely explanation.

The third patient, a boy aged 13, unvaccinated, became ill on April 10th, and was admitted to one of the fever hospitals as acute pneumonia on April 12th, developing a small-pox rash on the evening of the same day. His father, a dock labourer, had worked at the dock shed in connexion with another ship during the time of arrival of the *Tuscania* alongside, but had no connexion with this vessel or its contents. Any association of this kind must be regarded as much too slender, since it would in any case presuppose an incubation period of five days. On the other hand, the boy's father gave a history of having been ill a month previously, a few spots appearing on his face, the sole remaining evidence of which is some half-dozen faint pinkish marks on his forehead. The illness may or may not have been a very mild attack of small-pox. If so, the source of his infection is quite unknown.

Source of the Infection.

The list given above shows the dates of approximate sickening and the dates when the rash appeared. Taking the latter dates, the cases developed as follows: April 5th, one case; 6th, three cases; 7th, three cases; 8th, two cases; 9th, two cases; 11th, two cases; 12th, one case. Reckoning back fourteen days from these dates, it may be inferred that there existed a source or sources of infection operating continuously on board ship between March 22nd and 29th as an approximate period. Further, the widespread character of the subsequent outbreak among passengers and crew alike points to equally widespread opportunities afforded for contracting infection. According to a statement issued on April 25th by the Ministry of Health, 45 persons from the *Tuscania* have been notified as having small-pox from various parts of the country. A clear picture of the incidence of the outbreak awaits further detailed information, but it would appear that the great majority of those who contracted infection on board were passengers, waiters, and stewards. The evidence points strongly to the presence among one or other of these groups of a "missed" case or cases in an infective condition between the dates mentioned above. The possibility of this was recognized as soon as cases began to occur, but a careful examination of passengers and crew who had arrived in Glasgow failed to reveal the presence of any such recent infection. As there is no indication that the source of infection persisted after the ship left Marseilles, it may be surmised that the "missed" case or cases, unreported and unrecognized, had occurred among the passengers who landed at that port.

Revaccination of the ship's complement took place between March 29th and April 1st, all but three persons submitting. Those who disembarked at Marseilles were not revaccinated. As regards the cases which ultimately developed small-pox in Glasgow, it is apparent from the dates of this revaccination and those of sickening that these patients must have received their infection several days prior to the date of the adoption of this precaution. This procedure, though promptly undertaken, was, unavoidably in the circumstances, too late to prevent the damage that had been done.

As cases of small-pox began to develop in Glasgow and elsewhere it became apparent that the likelihood of a freely circulating source or sources of infection having been present on board had to be taken into account, and it was considered advisable not only to disinfect thoroughly the whole ship, particularly the sleeping quarters, but to remove for disinfection all the ship's linen, etc., amounting to 35,000 articles. The living quarters of the ship were finally cleaned out, and repainted by the owners.

The introduction of small-pox into this country by sea in such volume and with such wide distribution is, fortunately, unique in epidemiological experience. It frequently happens that a ship arrives at a home port from the East, having deposited a case or cases of small-pox at an intermediate port, or with a case or two on board. In many instances, revaccination of the ship's complement has already taken place on the occurrence of the first case. Removal of the sick, medical examination of the personnel, and revaccination, followed by surveillance for the prescribed period, has been the routine procedure followed. Within the past few years no instance has occurred of small-pox developing among contacts travelling to Glasgow by infected ships. The problem of administration set by the *Tuscania*, however, involving the strict supervision of so many contacts and the prompt detection of the first signs of the disease, gave rise to considerable difficulty and anxiety. From the ostensible medical data of the ship's voyage so great an aftermath of infection could not have been anticipated. It was impossible to reckon with the accident of the "missed" case and its inevitable sequel.

An unfortunate incident of this kind, even if most unusual, is an indication of the possibilities which may arise on ship board during transit from a country heavily infected with small-pox. The lesson of the episode is not so much a question of the imposition of strict measures of quarantine as of ensuring that passengers from, and crews of ships proceeding to, infected countries should be protected by recent revaccination.

Public Health Department,
Glasgow, May 6th.

MEDICAL CANDIDATES AT THE FORTHCOMING PARLIAMENTARY ELECTION.

THE following members of the medical profession have, we understand, been chosen for nomination as candidates for election to the House of Commons at the forthcoming General Election.

ENGLAND.

LONDON BOROUGHS.

*Dr. A. Salter (Lab.), Bermondsey West.
Dr. H. B. Morgan (Lab.), North-West Camberwell.
Dr. J. D. Cooke (C.), Peckham.
Dr. G. E. Spero (Lab.), Fulham West.
Dr. W. H. Summerskill (L.), Wandsworth (Balham and Tooting).
Dr. Ethel Bentham (Lab.), Islington East.
Dr. C. W. Brook (Lab.), Balham and Tooting.
*Sir Henry Jackson (C.), Wandsworth Central.

ENGLISH BOROUGHS.

Dr. R. O. Moon (L.), Oxford.
Dr. F. G. Bushnell (Lab.), Moseley.
*Sir Richard Luce (C.), Derby.
*Sir Thomas Watts (C.), Withington.
Dr. Joseph Robinson (Lab.), Withington.
Dr. J. W. Leech (C.), Newcastle-upon-Tyne West.
Dr. A. B. Howitt (C.), Preston.
Mr. Somerville Hastings (Lab.), Reading.
Dr. Haden Guest (C.), Salford.
Dr. Betty Morgan (L.), Sunderland.

ENGLISH COUNTIES.

Dr. J. V. Shaw (L.), Ilkeston.
Dr. R. A. Lyster (Lab.), Winchester.
*Dr. A. V. Davies (C.), Royton.
Dr. Stella Churchill (Lab.), Brentford and Chiswick.
Dr. R. Lyons (Lab.), Hendon.
The Right Hon. Christopher Addison (Lab.), Swindon.
*Dr. H. C. Haslam (C.), Horncastle, Lincs.
*Dr. F. E. Fremantle (C.), St. Albans, Herts.

WALES.

England and Wales.

The Eastman Dental Clinic.

THE foundation stone of the Eastman dental clinic at the Royal Free Hospital, London, was laid by the Prince of Wales on April 30th. This clinic is the result of a gift of £200,000 by Mr. George Eastman, chairman of the board of the Eastman Kodak Company, who, some years ago, founded a dental dispensary in Rochester (New York), and has been convinced that the marked success achieved there could be repeated elsewhere. To secure his offer for the building and equipment of a clinic in London a sum of £100,000 was provided by the generosity of Lord Riddell and Sir Albert Levy, respectively the president and treasurer of the Royal Free Hospital, to serve as an endowment fund. The maintenance of the clinic, however, is estimated at £20,000 annually, so that further sums are needed if the Royal Free Hospital is to be relieved of all charge in this connexion. The Prince of Wales emphasized the importance of dental health, and said that prevention, in the form of special provision for children and for expectant and nursing mothers, would be a feature of the clinic's work. He hoped that this compact institution, dealing with all aspects of dental healing, would give a further impetus to the education of public opinion in dental matters, and he added that this gift again exemplified the friendship which existed between this country and the United States. The Prime Minister, who made formal acknowledgement of Mr. Eastman's gift, remarked that teeth reacted upon digestion, and digestion upon temper, and suggested that if all people had perfect teeth there would be less gloom and pessimism in the body politic. Mr. Baldwin added that the generosity of the wealthy citizens of America had become proverbial; they gave their money in the wisest directions—towards education and health. No gift could be more welcome here at a time when such keen interest was being taken in the health of children and mothers. Without health there could be no proper education, and without education the future citizens could not take their proper place in the life of the country and of the world. Mr. Baldwin also paid a tribute to the devoted work which women, medical and other, were doing in the hospitals and clinics, and in connexion with women's and children's welfare. It was largely as a result of their labours that infant mortality had been reduced to one-half of what it was in his own youth. A visitor at the ceremony, Mr. Harvey J. Burkhart, director of the Rochester dental dispensary, brought the good wishes of the American Dental Association, of which he himself had been president.

Leicester Royal Infirmary and Children's Hospital.

In spite of the continuance of adverse industrial circumstances during the past year, there has been a considerable increase in the financial endowment of the Leicester Royal Infirmary and Children's Hospital. In the annual report of the board of governors for 1928 it is stated that for the first time in history the annual subscriptions of this institution passed the £10,000 mark. There was a slight fall in donations, but a "record" total of over £45,000 was received through the Saturday Hospital Fund, this representing an advance of £1,440 on the 1927 figure. During the year 242 new subscribing firms joined this fund, and it is confidently hoped that with the arrival of better trade conditions a total income of £50,000 from this source will be obtained. The extension and reconstruction of the Infirmary is proceeding. Rebuilding of the central wing was commenced last August, and it is expected that the new wing will be ready for occupation this year. We referred to the opening of two new operating theatres in our issue of February 2nd (p. 219), and the kitchens and domestic department have been simultaneously enlarged and improved. The number of in-patients during the year under review was 7,380, as compared with 6,788 in 1927. An interesting comparison is indicated in the annual report between the accident cases dealt with in the two years; it is noted that a large increase has occurred in traffic accidents from county areas, motor cars being particularly involved. The approximate cost of such traffic accidents to the hospital during the year is estimated at £1,851, and the expense incurred in respect of accidents generally now exceeds £10,000. Over £3,000 was devoted to the purchase of radium during 1928, and, since last December, this element has been available for use in the form of platinum needles, not only in the Infirmary, but also in certain other local hospitals; an increase in the demand for bed accommodation has naturally followed. Priority of admission to the Infirmary is given to cancer patients who are recommended from the local cancer clinic for operative and other treatment.

Child Guidance Clinics.

In consequence of generous financial assistance by the Commonwealth Fund, the Child Guidance Council hopes to open a clinic in Canonbury Place, Islington, during May. This will be available for the treatment of children of any age referred, with the consent of the parents, by the school medical officer of the London County Council, by child welfare centres, day nurseries, and social agencies, or by education authorities and agencies outside the London County Council area. Facilities will be provided at the clinic for the practical training of psychiatrists, psychologists, and social workers. Close co-operation is being established with the University of London and its various centres—for example, a one-year post-graduate course, beginning in October, is being established by the London School of Economics for the training of mental welfare workers, including those who devote themselves to children; special opportunities will be given by the clinic to those who attend that course. In a leaflet issued by the Child Guidance Council the importance of co-operation with all authorities, societies, and individuals concerned with the welfare of children is emphasized. It will be ready to place any information on the organization of clinics or of methods of training at the disposal of inquirers, and it is announced that meetings will be arranged or assisted in order to attract the interest of medical practitioners, parents, teachers, and social workers. Further information about the work of the council may be obtained from the secretary, 24, Buckingham Palace Road, S.W.1. In this connexion it may be recalled that the Jewish Health Organization of Great Britain opened a clinic last year for the study and treatment of maladjusted and delinquent children and adolescents of any race or creed (see *Journal*, October 13th, 1928, p. 675).

Proposed Bermondsey Health Centre.

The Bermondsey Borough Council recently applied to the London County Council for sanction to borrow £11,000 for the acquisition of a site for the erection of a building in which to establish "a clinic for the diagnosis and treatment of cases of rheumatism, arthritis, cancer, etc., and incorporating therewith various other existing services—namely, maternity and child welfare, tuberculosis, and dental clinic." (The London County Council report on the subject remarks that it is not stated what "etcetera" means, but it may cover the whole field of medicine and surgery.) The Finance Committee of the London County Council, after consultation with the Public Health Committee, takes the view that as the premises at present occupied by the tuberculosis dispensary and by one of the maternity and child welfare centres were purchased quite recently, and expenditure was incurred in rendering them suitable, the necessity for the proposed scheme appears to depend on the need there might be for the establishment of a clinic for the other purposes mentioned. As to this the county medical officer of health has advised that diseases such as arthritis, rheumatism, and cancer cannot be conveniently dealt with, either for diagnosis or treatment, except as part of the work of a modern hospital. To establish an *ad hoc* clinic as proposed, in the form of an out-patient department, as a separate unit altogether apart from the highly specialized equipment of the hospital, would be inefficient and expensive. The borough council states that there is not sufficient accommodation at the Bermondsey and Rotherhithe Hospital for the provision of the alternative scheme, but this is disputed. The Finance Committee is recommending to the London County Council that the application of the Bermondsey Borough Council be not entertained.

Ireland.

Public Health in the Free State.

IN his last report Dr. E. F. Stephenson, Chief Medical Adviser, Department of Local Government and Public Health, has stated, with regard to the appointment of county medical officers of health, that there is no reason for despondency at the delay in appointing county medical officers of health in the Irish Free State. The novelty of the position in the Free State and the adverse financial circumstances that prevail in some counties acted as deterrents at the outset, but the importance of the question and the necessity for whole-time health officers is now generally recognized, and it is felt that further delay in making the appointments cannot be condoned. Dr. Stephenson said that no other activity on the preventive side of public health administration gave a more direct return than the early diagnosis and treatment of children's ailments. The cost per child was inconsiderable; it purchased an increase of health, happiness, and efficiency for the individual, and cumulatively for the community at large, while it saved many from permanent incapacity. During 1928 approximately 12,000 children were inspected in Dublin. Of these, 7,000 had defects (one or more); 5,000 of these required treatment immediately, and 2,000 were under observation; 2,243 were suffering from their tonsils, and of these 507 required treatment, the remainder being put under observation; 1,433 suffered from defective vision, and of these 1,000 required treatment immediately, 433 being under observation. These figures did not include cases of squint, of which there were nearly 500. There were also 630 cases of external eye affection. Of skin diseases, including ringworm, there were 442 cases, 300 of which required urgent treatment, and 142 were under observation. There were 227 cases of ear disease, of which 132 required treatment, and the remainder were under observation. In Cork the scheme had been in operation for five years and the arrangements were more fully developed. The supervision of the school medical officers extended over the pupils at thirty-nine schools. In 1928, in course of inspection (excluding dental defects) defective vision constituted the most numerous group, followed by enlarged tonsils and by septic sores and minor injuries. Conditions of uncleanliness were detected in 17.5 per cent. of the children inspected, a slight improvement on the experience of the previous year, and 16.6 per cent. were found to be below normal standard as a result of defective nutrition. Of 5,605 school children examined for their teeth 3,531 were found to require treatment. In the counties Kildare, Offaly, and Louth, medical inspection was inaugurated towards the close of 1928, and already 3,549 school children had been examined in co. Kildare, 3,667 in Offaly, and 970 in Louth. Speaking generally, it could be said that inspection had revealed a high incidence of decaying teeth, defective sight, enlarged tonsils and adenoids, whilst all forms of tuberculosis, deformities, and cripples were fewer than anticipated. Provision was made under each scheme for the correction or treatment of defects of eyes, ears, teeth, throat (enlarged tonsils and adenoids), minor ailments, and conditions of uncleanliness. In affording treatment and correction, the existing facilities—hospitals and organizations—were used as far as possible. Ophthalmic surgeons and surgeon dentists attended at convenient centres, and cases requiring more specialized treatment were sent to them. In Dublin the general and specialized hospitals were used for the treatment of eyes, ears, and throat; and dental clinics were held at the Carnegie Institute. The general hospitals and the Eye, Ear, and Throat Hospital were utilized also in Cork, and defective teeth were treated at the Dental Hospital. In the counties, visiting ophthalmic surgeons and surgeon dentists attended at the extern department of the county hospital and at other convenient centres. Fifty per cent. of the cost of these services was borne by the State. This involved a great saving to the rates, as, in the absence of a school medical service, practically the entire cost of providing treatment would fall on the rates. During 1928 the following received treatment in Cork: (1) At the Eye, Ear, and Throat Hospital and by private practitioners, (a) operative treatment, 196; (b) refractions, 435; (c) glasses prescribed, 427; (2) at school clinics, minor ailments, 512; (3) at the dental hospital and by own dentist, 1,244. After-care and follow-up was generally carried out through district nursing societies, and, where district nurses were not available, by whole-time school nurses. There were 125 district nurses in the Free State, and six additional appointments were pending.

Infant Aid Society, Dublin.

The annual meeting of the Infant Aid Society was held recently in the Carnegie Child Welfare Centre, Dublin, under the chairmanship of Dr. R. J. White. The report stated that during the year 29,023 visits were paid by voluntary workers, 1,090 garments were provided for distribution by the sewing guild; 24 additional articles of clothing were provided by the pupils of Muckross Convent, and 108 were presented from other sources, making a total of 1,222. In addition, 446,360 pint bottles of milk were distributed. Of this number 426,686 were given free, and the remainder were sold at a reduced rate. This total was an increase of 112,668 over last year. Professor J. M. O'Sullivan, Minister for Education, in moving the adoption of the report, referred to the growing belief among the public that relief should be borne by the State, and deplored the acceptance of the idea which, he said, was based on a wrong ideal. His view was supported by Sir Joseph Glynn, who spoke of the need for voluntary workers, and described the appalling conditions in which some of the slum dwellers existed.

Scotland.

Mental Defectives in Scotland.

ARRANGEMENTS are being made in connexion with the visit of the Duke and Duchess of York to Edinburgh, at the end of the present month, for the laying of the foundation stone of a second instalment of the buildings at Gogarburn, intended to house mental defectives. The Edinburgh District Board of Control in 1923 purchased the house and estate of Gogarburn, comprising 58 acres of land, and shortly afterwards purchased a neighbouring estate extending to 361 acres, with the object of developing a scheme for mental defectives. This scheme, when completed, is expected to cost over £400,000, of which about one-half will be contributed by the Treasury. At the present time some 60 feeble-minded persons are accommodated in the renovated mansion house of the estate, and when the other buildings, of which the foundation stone is to be laid in the present month, are completed, there will be accommodation for 500 inmates. The scheme, however, includes plans to permit of extensions which, if necessary later, will raise the accommodation to 1,000 persons, and will serve both Edinburgh and the south-eastern counties of Scotland. Those of the patients who possess sufficient mental development will be employed in gardening, boot repairing, laundry work, and other suitable employment, and a part of the grounds has been planted with willow trees, of which the branches are intended for use in basket-making by the inmates. The institution will be not merely a place of detention for adult defectives, but also a place of training for educable children under 16 years of age.

Health of Dunfermline.

The annual report for 1928 to the magistrates of Dunfermline, by Dr. C. Barclay Reekie, medical officer of health for the burgh, has just been issued. With regard to infectious diseases, there have occurred in the burgh 118 cases of diphtheria, 236 of scarlet fever, 537 of measles, 151 of whooping-cough, and 128 of chicken-pox, these forming the chief causes among 1,342 notifications. There were no deaths from scarlet fever, but the number of notifications of diphtheria, of which the highest incidence took place in November and December, is the largest received for several

years. An outbreak of measles in February, March, and April attained epidemic proportions, and 5 cases terminated fatally. Whooping-cough was responsible for 4 deaths. Insulin was supplied to 10 diabetic patients during the year—to 4, in necessitous circumstances, free, to 6 on payment. There were 52 notifications of pulmonary tuberculosis, as compared with 47 in 1927 and 61 in 1926, and there were 21 deaths from this cause. Three health visitors were employed to make inquiries into the circumstances and home conditions when a notification was received, and the patient thereafter attended a tuberculosis dispensary or was visited by the medical officer of health. During the year there were 100 patients in the area suffering from pulmonary tuberculosis, and the total number of visits paid was 931. Sanatorium treatment was carried out in three sanatoriums, the admissions during the year for pulmonary tuberculosis amounting to 30. Considerable activity had taken place under the maternity service and child welfare scheme. Forty-four infants died within the first year of life, as compared with 52 in the previous year, death in 22 cases being due to ante-natal causes. The infant mortality rate was 69, as compared with 78 in the previous year, the number of deaths registered having been 686. Of these, 542 cases were attended by a doctor, and 144 by a midwife. There were now four child welfare clinics in the burgh and its environs. The local authority had some time ago established a maternity home, and in this 278 cases were treated, an increase of 64 over the number of the previous year. Out of the 703 children whose births had been registered during 1927, 364, or over 50 per cent., were successfully vaccinated, while declarations of conscientious objection were lodged in respect of 230, or 30 per cent. The corrected death rate amounted to 12 per 1,000 of the estimated population.

Edinburgh University Medical Buildings.

At the statutory half-yearly meeting of the general council of the University of Edinburgh, held on May 1st, Principal Sir Alfred Ewing presided, and referred to his resignation of the office of principal at the end of the current academical year. He commented on the very exacting nature of the office and the heavy tasks that it involved, for which in the future he felt himself unequal. The Scottish universities, he said, were very fortunate in their constitution, and the people who had framed them had been extraordinarily far-seeing, for the constitution admitted of expansion and had produced valuable and effective progress in recent years. Great developments were now proceeding in the scientific departments at the King's Buildings, and progress had been made in the departments of arts and medicine. One of the last acts with which he had been concerned as principal was a scheme for the interior reconstruction of much of the medical buildings. Those buildings had been a splendid novelty in their day, but they had become out of date owing to changes in the subjects to be taught and in the manner of teaching them. A drastic internal reconstruction would be necessary, which would cost something like £60,000, but he believed this money would be available before he relinquished office. He referred also to the recent development of hostels for students at Edinburgh.

New Principal of Edinburgh University.

The curators of Edinburgh University have offered the principalship of this University, rendered vacant by the retirement of Sir Alfred Ewing at the end of the present session, to Sir Thomas Henry Holland, K.C.S.I., D.Sc., F.R.S., rector of the Imperial College of Science and Technology, London, and he has accepted the appointment. Sir Thomas Holland is at present in South Africa; he is in his sixty-first year, and has held several important appointments in India. He was in charge of the geological survey of India from 1903 to 1909, was chairman of the trustees of the Indian Museum for four years, and president of the Burma Oil Reserve Committee in 1928. For a considerable period he was associated with Calcutta University, where he became dean of the Faculty of Science in 1909. In 1915–16 he was president of the Institute of Mining Engineers, and from 1909 to 1918 he was professor of geology and mineralogy in Manchester University. During the war he was president of the Board of Munitions of India. He has published numerous memoirs on petrology, geology, and anthropology.

Poliomyelitis in Orkney.

A report was submitted to the meeting of Orkney County Council, held at Kirkwall on May 3rd, from Dr. Bannerman, medical officer of health for the county. In this communication the medical officer reported that an outbreak of poliomyelitis had occurred in the island of Stronsay. A number of persons had been affected, and two patients had died of the disease. The others were, however, progressing favourably, and the epidemic was well under control. All known contacts had been placed under observation and isolated as well as possible. It was not anticipated that the disease would spread further, though it was possible that some of the contacts might still develop it.

Correspondence.

TESTIMONIAL TO SIR RONALD ROSS.

SIR,—We, the undersigned, write to inform your readers that a Fund, called the Ross Award Fund, is being started in order to give some recognition to Sir Ronald Ross, K.C.B., K.C.M.G., F.R.S., for his discoveries on the mode by which malaria is carried and for his lifelong efforts regarding the prevention of that disease. Those wishing to subscribe may send their donations to Lloyds Bank, Ltd., 110, High Street, Putney, London, S.W.15; cheques, etc., to be crossed "Ross Award Fund a/c."

The sum of *£244 13s. 6d. has already been subscribed* spontaneously by American friends and some personal friends in England, and this necessitates some definite action being taken here in the matter, in order to put such donations on a proper basis.

We have to thank you, as Editor of the *British Medical Journal*, for consenting to publish a list of the names of the donors from time to time in your columns, in order to minimize clerical work.—We are, etc.,

JAMES BARR.	G. H. F. NUTTALL.
CHARLES BROQUET (Paris).	EDORADO PERRONCITO (Turin).
J. P. CARDAMATIS (Athens).	ROBERT L. PITFIELD (Philadelphia).

EWEN J. MACLEAN.	F. PARKES WEBER.
BERNARD NOCHT (Hamburg).	

THE DISTRIBUTION OF RADIUM.

SIR,—On reading the recently published Radium Subcommittee's report one is struck by the immense amount of work which has been carried out and the amount of knowledge accumulated by the committee.

Anyone who has worked with radium in this country during the last few years and who is conversant with the work on the Continent will have welcomed Mr. Souttar's letter on April 27th (p. 787), and the very useful suggestions it contains. Until recently we abused rather than used radium, and it is only of late that any change has taken place. This is largely due to the efforts of Mr. Malcolm Donaldson, who arranged for a large number of surgeons to visit the Curie Institute, where real scientific work in treatment with radium was viewed for the first time. Since that date scientific investigation on the same lines has been carried out in this country, and, as far as our restricted stock of radium has allowed, we have performed quite as good work as anywhere else.

I can echo what Mr. Souttar says about the advantage of using, at the hospitals, the emanation of radium called "radon," rather than radium itself. Not only does the country require the 20 grams of extra radium mentioned in the report, but it requires men who know how to use it, and centres from which it can be used; France already has these centres, with subcentres all round.

I would put in an urgent plea that those hospitals which are already using radium and which have among the members of their staffs some who are at any rate conversant with its use, should be given sufficient radium as soon as it is available to enable them to turn out radon. The amount of radium necessary for this is roughly half a gram at each centre; special apparatus must be installed for the production of radon, but this is easy and not very expensive. These could form the first centres of the system. Gradually the system can be expanded, but it must be remembered that it is easier and quicker to buy radium than it is to train men to use it.

Radon at the present time cannot be obtained in anything like sufficient quantities, and we have to use radium. Radium has certain advantages, especially to the private owner, but the risk of loss and the worry of looking after it is excessive; I speak from experience, as I have a quarter of a gram under my charge. During the last few years I have been constantly asked to send this radium to doctors in the country that it may be inserted into their patients; but, knowing that the doctors have no knowledge whatsoever of radium treatment, I have had to refuse to allow any to go. Radon—which they think is the same as radium—can, however, be obtained, and I have known of this being sent after I had refused to send radium.

Perhaps the most extreme example of ignorance was in the case of a patient I saw in the country a little while ago; I found her suffering from deep carcinomatous ulcers, one of which was six to eight inches across; it had been thought radium might benefit this condition. The doctor, who knew nothing about radium beyond what he had read, wrote to an institution and received a plaque of radon; the dose he could not tell me, and he did not even know that the dose was important. It would have been impossible to place this for twenty-four hours over the whole of the ulcerated surface before the radon had all decayed. One can hardly find words to describe such a travesty of treatment. This sort of treatment has already begun and should be stopped at once.

Radium treatment requires specialists who have had experience which can only be gained through long training, such as we surgeons, who begin to know how radium should be used, still feel the need of. On the other hand, radium is, and must be, regarded as a surgical instrument, and any attempt to treat cancer without a thorough surgical training will end in disaster.

Special surgeons should be appointed to conduct each centre in co-operation with radium specialists, and then only will success be possible. At present we have neither radium specialists nor the surgeons to supply the centres.—I am, etc.,

DUNCAN C. L. FITZWILLIAMS.

London, W.1, May 3rd.

SIR,—I am at one with Mr. Souttar in his anxiety that the radium held by the National Radium Trustees should be most efficiently and economically used, but I would suggest that his outlined scheme is hardly likely to achieve these objects, and, indeed, has many inherent defects.

1. It tends to create a monopoly. All monopolies are bad, in medicine very bad. The physical properties of radium and some of its biological effects are well known, and there are several well-recognized techniques for its employment; the greater the number of brains trying to interpret these effects and to improve the various techniques the better. There is considerable risk of stereotyped methods developing in large central clinics.

2. It will eliminate or seriously hinder the individual worker. Some of the recent advancements in technique have admittedly been due to the individual worker: more can be expected of him, and he should be encouraged.

3. It would possibly be another step towards a State medical service; it would certainly be a great encroachment on private practice. One may take it that these radium experts will be salaried, and if the State provides half the salary it will certainly demand a say in the conditions of their employment. At one end there would be the panel, at the other the radium centre.

4. It does not suggest sufficient provision for patients not of the hospital class.

5. By branding the vast majority of medical practitioners as incompetent to apply radium it would greatly damage the none too high prestige of the medical profession in the eyes of the public.

The scheme is sketched in bare outline and it would be unfair to criticize any but its main points: (*a*) The proposed number of centres is far too few. I suggest that the distribution should be as wide as possible, and that, figuratively speaking, radium should be brought to the door of the general practitioner. (*b*) Until radon is proved to be as efficacious as radium it would be disastrous to run subsidiary centres on radon alone. Although radon is the actual source of radium's power it has one outstanding difference therapeutically—the radiation from radium is constant and even, that from radon rapidly becomes less intense, and in seven days its value is practically *nil*. Much larger initial amounts of radon must be employed to give the amount of radiation that would be obtained from a small relative amount of radium, and even then the duration of the application cannot be so prolonged. It is from the small prolonged dose of radium that the most brilliant results have been obtained. (*c*) By implication the scheme deals with cancer; there are, however, a number of gynæcological conditions causing widespread ill health which are most suitably treated with radium, and these should certainly be catered for. (*d*) The most startling feature in the scheme is that it would debar the vast majority of surgeons from using the radium held by the National Radium Commission. Such restriction would be unique, and its imposition a retrograde step.

I suggest that individual surgeons should be allowed to avail themselves of the use of this radium, but on condition that they render satisfactory notes and reports of the immediate and subsequent history of the patients in whose treatment they have used it. Surgeons failing to comply with this condition should naturally lose the privilege of obtaining supplies from the Radium Commission. One may hope that when radium or radon is available, the charge for its hire will bear a reasonable relation to its cost.—I am, etc.,

Southsea, April 30th. R. K. WHITE, F.R.C.S.Ed.

THE MEDICAL PROFESSION AND UNQUALIFIED VETERINARY PRACTICE.

SIR,—May I be given an opportunity of asking the sympathetic attention of the medical profession to the following matter? In a recent action for slander brought by an unqualified woman practitioner against a qualified veterinary surgeon, the plaintiff called three medical practitioners to testify as to her skill in the medical and surgical treatment of animals: Dr. X said he had sent animals to the plaintiff and had also recommended her to patients of his; she had been extraordinarily successful in her treatment of the animals; Dr. Y said that for a good many years he had sent animals to the plaintiff for treatment, and that he was satisfied with the treatment; Dr. Z said she had sent a dog, which was ill from obstruction of the bowel, to the plaintiff and she had treated it successfully.

These three medical practitioners appear to be well aware that the plaintiff is an unqualified person, but nevertheless they not only consult her, but recommend her to others. May I suggest for the earnest consideration of your readers that it is to be deprecated as a matter of principle that members of the sister profession should give their support to unqualified persons in animal medicine and be willing to come forward and give evidence in their favour. I think it will be agreed by medical men that it is not necessarily certain that a medical practitioner is competent to judge whether any particular treatment is the correct treatment to give in the case of ailing animals, yet to a jury of unprofessional people the fact that members of the medical profession were on the side of the plaintiff would be likely to lead them to believe that the plaintiff was in some manner qualified.

Medical men ought really to be the last to give encouragement to unqualified practice in any form, and I plead that they should treat the sister profession with

some sympathy. The two professions are closely related; the laws governing them are practically identical; the same professional discipline is applied to practitioners in both branches; and, as much recent work has shown, they are close allies in research. Let us, therefore, be allies in protecting the public.—I am, etc.,

Royal College of Veterinary Surgeons, London, W.C.1, May 4th. FRED BULLOCK, Secretary and Registrar.

FORTY YEARS' MEMBERSHIP.

SIR,—It has been suggested that some form of friendly association, similar, perhaps, to the "Old Boys" societies of many public schools, might be formed by those members of the British Medical Association who have attained to forty years' or longer membership. These members would have similarity of interest in point of time and past experience, and possibly such a society might also be an inducement for continued membership of the British Medical Association when some regard it as unnecessary on account of having relinquished active work.

The number of members of the British Medical Association of over forty years' standing is now 968, and it would be of importance, before further steps are taken, to have the opinion of those interested, either through the medium of the *British Medical Journal* correspondence page, or on a postcard addressed to the undersigned. Amongst others, Mr. G. Morgan, a past-president of the Sussex Branch, gives his support to the suggestion.—I am, etc.,

Meadowside, Burgess Hill, Sussex, April 30th. W. W. SHRUBSHALL, Vice-Chairman, Brighton Division.

THE INTRACUTANEOUS TUBERCULIN TEST.

SIR,—I noted with surprise the letter of Mr. Basil Hughes in your columns on April 27th (p. 789) as a contribution to the discussion on intracutaneous tuberculin tests. I had assumed that by now Dr. Wildbolz's urinary tests were gone and forgotten, as they deserve to be; but from Mr. Hughes's letter it seems that they are being resuscitated and presented in a slightly new form.

Dr. Wildbolz first presented a communication on this subject to the French Congress of Urology in October, 1920, when he stated that the urine of subjects of active tuberculosis contained tuberculous antigens. He recommended the use of specially prepared urine for the purposes of an *intradermal* test, and stated that that method depended upon the allergy of the tissues of tuberculous subjects for tuberculous antigen. To prove that the patient would react—that is, was allergic—he gave control intradermal injections of old tuberculin (Mantoux's method). He further insisted that when a tuberculous focus became encapsuled and completely fibrosed the antigens disappeared from the serum and urine of that subject, and hence no intradermal reaction was given on injection of autogenous prepared urine. Dr. Wildbolz seems to have overlooked the fact that, assuming his statements to be true, there is nothing to preclude the kidneys from excreting other antigens besides those of tubercle. It is well known that phthisical patients, especially in towns, are subject to mixed infections. It is thus impossible to limit the type of antigen present in a given urine to that caused by the tubercle bacillus alone. If a phthisical patient with a superadded streptococcal infection reacted to his urine the reaction would be no proof that he was tuberculous, since he is also susceptible to his streptococcal antigen.

In 1921, while house-physician at the Brompton Chest Hospital, I performed an investigation to decide on the diagnostic value of urinary skin reactions. With Dr. Cecil Wall's consent and clinical control, I gave a series of injections to his in-patients. The concentrations were made by the Lister Institute, and the material was kept in hermetically sealed sterile ampoules in the interval before use. I can only say in the compass of this letter that my results showed that Wildbolz's method was not reliable enough to be of any practical use in the diagnosis of active tuberculosis. I have not heretofore troubled to publish my results.

I very much doubt whether giving these injections intramuscularly, as stated in Mr. Hughes's letter, will make the method any more reliable. The reaction obtained by the revised method is stated to be an active oedema. What this means I do not know; perhaps, when hidden in the intramuscular planes, the detection of reaction is more dependent on that elusive possession—clinical acumen!

I can quite understand Dr. Wildbolz becoming uncertain of intracutaneous reactions when we remember the pseudo and combined reactions given by both the Schick and the Dick tests. Bearing this in mind, I can also appreciate Dr. Camac Wilkinson's desire to receive full details from Professor Lyle Cummins as to what he means by a positive intracutaneous tuberculin reaction.—I am, etc.,

London, E., April 29th. MARK TREE.

THE RELATION OF ALASTRIM AND SMALL-POX.

SIR,—With reference to the relationship of alastrim and small-pox or variola major, may I give an experience of mine some years ago? I was called to a farm some twenty miles from town to see a girl, aged about 18, whom I found suffering from small-pox in a moderately severe form, the pocks being numerous but discrete. On inquiry I found that among the natives on the farm, some fifteen in number, there had been eleven cases of what they called Kaffir-pox; two still showed dried-up pustules and had evidently all been cases of amaas or mild small-pox. The only patients who had escaped were some old men who had had the disease and two youngsters who had been vaccinated in Basutoland. Five of the younger children of the white family had had it and were convalescent. The last patient, this daughter, had the disease much more severely than any of the others, and, alarmed by the appearance of her face and body, which were covered with big pustules, the parents had sent for me. I vaccinated all those who had not yet had the disease, but found that the father was already infected, and showed the prodromal symptoms and temperature. Three days later I visited the farm again and found him the victim of a very severe confluent attack, from which he died. Evidently the mild disease, like others of the exanthemata, may become intensified in virulence and pass into variola major. Precautions should never be relaxed, and all possible means should be taken to cut short an epidemic, even if the cases are all mild to begin with.—I am, etc.,

JOHN A. GRAHAM, M.B., C.M.

Bethulie, South Africa, April 8th.

INTRAVENOUS INJECTION OF UROTROPINE.

SIR,—In the account of the meeting of the Sections of Urology, Pathology, and Therapeutics of the Royal Society of Medicine published in your issue of April 6th (p. 645), I notice that in discussing urinary antiseptics no mention is made of urotropine given intravenously. Mr. Swift Joly is reported as saying that there seemed to be practically no antiseptic of any value at all at the kidney level.

My experience is that in cases of acute pyelitis the intravenous injection of urotropine is truly a specific. In a few hours a temperature of 104° to 105° F. falls permanently to normal, and the pus disappears from the urine. I inject 5 c.cm. of 40 per cent. urotropine solution as supplied in ampoules by Schering. This is the usual treatment of acute pyelitis by Continental practitioners; it is quite devoid of unpleasant effects, and may be repeated (if necessary) twice daily for some days. I should add that it appears to be of very little, if any, benefit in cases of cystitis.—I am, etc.,

Alexandria, April 15th. E. N. RUSSELL.

TREATMENT COMMITTEES:

A Suggestion for County and County Borough Councils.

SIR,—In connexion with the transference of Poor Law functions to county councils and county borough councils, may I suggest that it would be wise for medical men to use what influence they can to persuade each of these bodies to set up a new committee to deal with all forms of the treatment of disease. The public health committee would then control only the prevention of disease, and I submit that this should be the sole duty of the medical officer of health, as its official. All treatment of disease, whether in

hospital, sanatorium, out-patient clinics, or the patients' own homes, and the treatment of children of every age, would be under its supervision. The medical officer of health is not necessarily (if a whole-time officer not usually) a person with special experience in the treatment of disease, and his duties should be confined to its prevention. Even the treatment of cases of infectious disease is not, I think, in his province, though for convenience of administration it is usually allotted to him. His real business is to prevent their occurrence, and to prevent further infection from those under treatment.

On this treatment committee which I propose should be set up, or on a hospital subcommittee of it, should be co-opted men of special experience in hospital work, both medical and administrative; and on the committee should, I think, be co-opted medical practitioners experienced in all the other work of the committee, including medical men or women specially experienced in diseases of children. I suggest that maternity work should be placed under this committee, as it is more a matter of treatment than of hygienic measures during pregnancy, and that some skilled obstetricians should be co-opted on it, and perhaps the child welfare work should also be under this committee. All Poor Law asylums will doubtless be transferred to the asylums committees of the councils, and I suggest that mental deficiency work should be transferred to this committee also.—I am, etc.,

CHARLES A. MORTON.

Bristol, May 5th.

MEDICAL INSURANCE AGENCY.

A Scottish Office.

SIR,—Owing to the enormous growth and ever-increasing pressure of work in the Medical Insurance Agency, the Committee of Management have decided to establish an office in Edinburgh, which they feel sure will have the effect of minimizing the delay in dealing with inquiries and claims from the profession in Scotland and the counties of Northumberland and Durham.

The Scottish Office will be under the control of Mr. R. Chalmers Fergusson, and he will commence his duties at the British Medical Association House, 7, Drumsheugh Gardens, Edinburgh, on June 1st.

It may be that the arrangements we have made will need variation, but we shall alter these if necessary in order to carry out our primary purpose—namely, giving sound and unbiased advice to doctors in matters relating to all classes of insurance.—I am, etc.,

L. FERRIS-SCOTT,
Honorary Secretary.

Medical Insurance Agency, B.M.A. House, Tavistock Square, W.C.1, May 1st.

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

Estimates for Health Services.

THE House of Commons went into committee on May 1st on estimates of £14,228,664 for Ministry of Health services in England and Wales. Introducing the estimates, Mr. CHAMBERLAIN said the constantly recurring increases in the expenditure of his department grew with the increase of population, and the extending appreciation on the part of the people of the benefits which they received from health services. Housing was the largest single item of cost in the estimate, and the increase in that item was £485,000, rather greater than the increase in the total estimates. An abnormal spurt in building had ended in September, 1927, and nothing like it would recur till housing authorities were satisfied that prices had touched bottom. The total of houses completed in 1928 was not less than 169,000, the vast majority of them under an annual value of £26 a year. Since the armistice 1,241,500 houses had been built in this country. Local authorities were responsible for 467,500. The pensions work of the Ministry was proceeding with satisfactory regularity, and 88,560 old people, widows, or dependent children had been freed from dependence on the guardians by receipt of pensions and allowances. During last year the new National Health Insurance Act came into force, and its provisions had proved beneficent. The genuinely unemployed now lost nothing of their health benefit by reason of arrears. The Act of 1925 had brought in 200,000 voluntary contributors who had previously been excluded. The extension of national health insurance by the Act of last year to share fishermen and certain other workers had been received with satisfaction. Turning to the health services, Mr. Chamberlain said the estimates before the House were probably the last main estimates for his department which provided percentage grants. Another service aided by a similar grant was that for which the Board of Control was responsible. That Board was responsible for the treatment of insane persons, and also of mental deficients, work which was not very attractive, but very valuable to the community. At present about 141,000 insane persons were under care in England and Wales. That number showed a fairly regular increase of about 2,000 a year, an increase not necessarily meaning that the proportion of insane persons to population was increasing at that rate. Insanity was a disease affecting adults and not children, and as the expectation of life continuously increased, so a larger proportion of the population became susceptible to this disease. The figure of recovery was less satisfactory. It was surprising and disquieting that the rate of recovery among insane persons seemed always to remain at about 30 per cent. One might, however, assume that medical superintendents were more careful in classifying cases as recovered than they used to be, and that an increase might exist which was not reflected in the figures. He could not say how the figures of recovery compared with those in foreign countries. The one class of case in which there was a definite improvement in recovery was the case of general paralysis of the insane. The new treatment of that was to give the patient another disease—malaria. By it general paralysis of the insane was in many cases capable of considerable improvement, and possibly of cure. As part of the equipment of a mental hospital to-day a portion of a ward with one or two beds in it would be shut off and surrounded by mosquito curtains. An infected mosquito was brought down from London and introduced, and after that the matter worked out in its own way. He wished that further progress could be made in lunacy research, for which at present local authorities had no power to devote money. It was one of the matters which might well arise out of the report of the Royal Commission on Lunacy, a report which would, he hoped, provide part of the work of another Parliament.

Mental Deficiency.

Turning to mental deficiency, he remarked that some misunderstanding had arisen on the attitude of the Ministry of Health to the Wood Report. That committee issued two very long reports on various matters concerned with mental deficiency, and he had said that he must have time to consider that part of the report which dealt with adults before he could say whether all or how much of it should be published. He had no intention of withholding from local authorities anything they ought to know which was in the report. Probably the most important part of it for them consisted of the figures of Dr. Lewis's investigations into mental deficiency, which had already been published. The rest was having his personal consideration, and he hoped to make a decision on it before long. Dr. Lewis estimated there were 300,000 mental deficients in this country, about double the estimate of the Royal Commission in 1908. That must give rise to serious anxiety and apprehension. In some countries a system of sterilization was practised, and the Ministry of Health was asked why it should not follow that example. Personally, he thought that some day there would have to be a scientific inquiry into this. Up to the present they had not sufficient data to enable them to come to any satisfactory and definite conclusion. But he would say this, that the mental deficients of the country were the product of one-tenth of the population, and out of that one-tenth only one-tenth, or 1 per cent. of the whole, were themselves definitely defective. The others might be indefinitely defective, unrecognizable as such, or might only be carriers. Therefore any process of sterilization could not possibly deal satisfactorily with the problem. He could not say that the mental deficients came from any special district or class in the community. They were widely distributed. The ideal method for dealing with them, in the light of our present knowledge, was in colonies, which, if they were to be carried on with greatest efficiency, must consist of not less than 1,000 persons. These colonies should be places where mental deficients should, as far as possible, be trained to a point where they could be released under licence and supervision. It was impossible to carry out the ideal of that kind at a single step. To provide one of these colonies was costly, and the Government must have regard to the financial limitations of the country. They would have to proceed slowly. Even now they could do much to mitigate the lot of these unfortunates and render them less dangerous to society and to themselves. Under the Local Government Act which placed many institutions in the hands of county and county borough authorities, it would be possible to devote some of these institutions to reception of certain types of mental deficients and insane persons. Seeing that the cost of a bed in a mental hospital was about twice that in a mental defici-

colony, local authorities would perhaps make a bargain for themselves if they allotted some of these institutions to the treatment of insanity.

Miss WILKINSON asked whether the Minister proposed to increase the care of the borderline cases not yet certified.

Mr. CHAMBERLAIN said he could not, under the rules of the House, discuss the question of legislation for such a purpose, but so far as administration was concerned his answer was "Yes." To make further provision for borderline cases was part of the general policy which was being pursued by the Board of Control all over the country.

On May 6th Lord EUSTACE PERCY told Mr. R. Morrison that the mental deficiency report was receiving his careful attention, but local authorities and other bodies concerned must also have time to consider its recommendations before any proposals for action upon them could usefully be discussed. Sir KINGSLEY WOOD, on the same day, informed Mr. Morrison that the Minister of Health was giving his personal consideration to the adult section of the report, and hoped to be able to make a decision with regard to its publication before long.

State-aided Services.

Mr. Chamberlain then turned to State-aided health services. He said that four came under the Ministry of Health—tuberculosis, venereal diseases, the welfare of the blind, and maternity and child welfare. The year 1928 gave the lowest death rate on record both for pulmonary and non-pulmonary cases of tuberculosis. In the non-pulmonary tuberculous cases 60 per cent. of the decline occurred among children. The death rate among such cases from 1901 to 1910 was 500 per 1,000,000. Last year it came down to 173. At the same time the condition of those who survived was much better than it used to be. Many a child went about to-day with straight legs who formerly would have been a permanent cripple. Blind persons were better looked after to-day than ever before. In 1922 there were 8,000 cases of ophthalmia neonatorum. In 1927 that number had fallen to 5,000. The maternity and child welfare work had produced the most striking results in all the health services in the last generation. The infant mortality rate came down from 70 per 1,000 in 1927 to 65 per 1,000 in 1928. In the five years he had been at the Ministry of Health it had declined from 75 to 65 per 1,000. In 1923 6,550 babies survived which would have died had they been born under the conditions of 1924. The lives saved were a barometer of the general rise in the standards of health of young children. This wonderful fall in the death rate was the product of a number of causes, but the actual expenditure on grants proved there was a steadily expanding service for which a major share of the satisfactory results might be claimed. In 1924–25 £814,000 was spent by Exchequer grants on maternity and child welfare services. In 1928–29 the sum was £1,072,000, and in the present estimates £1,163,000 was set apart for the purpose.

Maternal Mortality.

A year ago he had told the House that the figures for maternal mortality had practically not moved for twenty years. He set up two committees, one to inquire into the conditions affecting the practice and profession of midwifery. That committee had nearly completed its labours, and he hoped in a few weeks to have its report. The other committee was directed to throw more light upon the causes of these deaths. Even now they were largely ignorant of the causes of this persistent maternal mortality. He had set the investigation on foot with the help of the general practitioners of the British Medical Association and of the local authorities with a view to getting a report on every case of maternal death right through the country. The committee began to function in the latter part of last year, and 311 deaths formed the subject of reports in 1928. This year already the Ministry had reports of 448 more cases. It is too soon to say what conclusions they would be able to draw from this evidence, but already the focusing upon these cases had begun to show indications from which they believed they saw flaws and weaknesses in the system. The arousing of public attention upon the lamentable results to the health and life of this nation which come from this persistent mortality meant that greater care was given already before and after birth. He said with some confidence that from the mere fact of this attention they would see a large reduction in this mortality.

Small-pox.

There had been a good deal of discussion on small-pox within the last few weeks, and embarrassing restrictions had been placed upon the entry of British nationals into another country. That had arisen partly owing to certain cases of virulent small-pox which came to this country in a ship. He did not think that this state of affairs would have arisen had it not been that the attention of other countries had been drawn to the mounting figures of cases of small-pox of a mild character which had been so remarkable a feature of the last few years. In 1927 there were upwards of 14,000 such cases. Last year there were not quite so many, and the fact of these cases being mild has tended to prevent anxiety. He felt that as long as a large part of the population were unvaccinated the public was running a risk which might seem small to-day, but which, if a really virulent type should spread, might cause a panic.

Cancer and Radium.

Unfortunately the number of cases of cancer was still on the increase in England and Wales, nor had the Ministry been able, in spite of research, to say they had got to the real cause of cancer or of the agencies which encouraged its development in the human body. What they could say was that, after many experiments and some mistakes, they had obtained a fairly practical working knowledge of a method of treatment which had in a great number of cases been singularly successful and had superseded older methods of surgery. He referred to treatment by radium in one form or another. The demands for the substance had become pressing and urgent. It was found in workable quantities in few spots in the world, and required most careful handling in its preparation. It was a very costly substance. A subcommittee appointed by the Committee of Civil and Industrial Research had informed the Government that 20 grams of radium, all that could be properly and efficiently used at this moment, could be obtained at a cost of £200,000. In the opinion of the subcommittee it was desirable that the Government should offer pound for pound for any sums raised for this purpose by the public, and the Government felt that they must at once accept that recommendation. As a result of the appeals made in the press a large share of the sum required had been forthcoming. This appeal had the sympathy of many people. It was a satisfaction to him at the end of this period of office to find that something had been done to bring relief in future to many sufferers from this most terrible and terrifying of diseases. He was confident that in a few days the necessary money would be secured. He hoped he had convinced members that the money spent on the health services of the Ministry of Health brought an ample return in the improved health and efficiency of the people.

Debate.

Mr. ARTHUR GREENWOOD, for the Labour Party, moved to reduce the estimate by £100, and contended that the country should now be building over 200,000 houses a year.

Mr. HOPKIN MORRIS said the report of the Wood Committee on mental defectives had been originally presented on January 19th as one report, not, as now appeared, two reports. Mr. Chamberlain referred it back to the committee and asked them to divide it. The committee reluctantly agreed. They regarded the section of the report which dealt with adults as part of the same problem as that relating to the children. Why should local authorities be debarred from a knowledge of this report? Dr. Tredgold, a member of the committee, was reported in the *Times* on April 26th as regretting that the Government departments concerned should have required the report to be divided, and that the part dealing with adults should not have been published. Mysterious influences were at work to delay or even prevent publication of the considered opinions of an independent committee on such a subject. Dr. Tredgold had further said he doubted whether the public authorities who were charged with the duty of providing for these defectives would tolerate such an autocratic procedure. Mr. Chamberlain had said there was a good deal of misapprehension about this report. Why did he not explain how it had not been published? The figures and investigations of Dr. Lewis had been published; why not the whole of the findings of the committee? The *British Medical Journal* was not a partisan paper. It could not be accused of political opposition to Mr. Chamberlain or of political bias. It had said: "The portion of the report which deals with adult defectives is still mysteriously withheld. Neither delay nor withholding is the fault of the joint committee themselves. . . . In the public interest it is necessary to press for, even insist upon, the early publication of the missing Part III."

Dr. VERNON DAVIES said Mr. Chamberlain's statement had been lucid and interesting, but, probably owing to lack of time, had not dealt fully with health services. Even after all that had been done in the last four years, an appalling amount of work remained to do in connexion with health services. Undeniably there was anxiety over the non-publication of the adult part of the report on mental deficiency. He hoped Mr. Chamberlain would give the matter his immediate attention. Mr. Chamberlain had mentioned the large number of lunatics in the country, and had accurately stressed the point that lunacy was a curable disease. It was important to bear in mind that a large number of people on the borderline could, by proper treatment in mental hospitals or in other suitable hospitals, be prevented from going over the line and brought back to normal. That was an urgent and vital work before the Ministry of Health, and its essential was the treatment of a class of mental patients without certification. Dr. Davies remarked upon the discredit popularly attached to persons suffering from mental illness, and said that until the Ministry of Health brought in legislation to deal with the report of the

Royal Commission on Lunacy, there would be this feeling in the country towards people who suffered from mental affliction.

Small-pox, Dr. Vernon Davies continued, was another important question. The home of Jenner, the country which first discovered the principle of vaccination, and which first dealt with small-pox, was held up to the ridicule and horror of the world. France, a neighbouring and friendly country, had in a moment of panic issued a drastic order directed against this country. Brazil was objecting to the admission of people from Great Britain unless they had been vaccinated. A publication of the International Labour Office or of the Health Commission had said that this was the worst vaccinated country of the world. The Rolleston Committee had suggested alterations in regard to vaccination, and Dr. Davies hoped Mr. Chamberlain would see the country had efficient administration to get rid of the curse of small-pox. Dr. Davies remarked that the House of Commons would probably have an opportunity of discussing, on the Supplementary Vote for Radium, the question of cancer and the Radium Fund. Though radium was a substance of enormous value in the treatment of certain forms of cancer, it was extremely dangerous and ought only to be handled by experts. Having obtained radium, they must ensure it was only used by medical men who were thoroughly expert in its use. He was not afraid that the country would not get a sufficiency of radium, but that for some time there would not be a sufficiency of experts in its use. The House appreciated the fact that Mr. Chamberlain had set up committees on maternal mortality, but Dr. Davies was convinced that the secret of maternal health was efficient midwives, properly trained, and above all that babies should be born in satisfactory surroundings. The Minister of Health had said he had made inquiries from medical men in the country on the causes of deaths in childbed, and that inquiry had already led to an improvement. That could only result from extra care by the doctor or nurse, or attendants, and from a little more cleanliness. If such extra care and attention were going to save lives, that alone would justify Mr. Chamberlain's work. Unfortunately Mr. Chamberlain had said little about tuberculosis, and the House had not the report for last year. Had there been improvement in the compulsory notification of phthisis? Was the dispensary system functioning? Was the Ministry co-operating with the medical men, with the sanatoriums, and with the hospitals? Would Mr. Chamberlain ensure that under the Local Government Act the tuberculosis service was worked as a complete unit? If it was necessary to have a full-time medical officer for health services, it was ten times more important to have a full-time tuberculosis officer. The essential thing in tuberculosis was early diagnosis, and that was for the expert. The Ministry could not expect the ordinary general medical practitioner, who had not the latest means at his disposal, such as *x* rays, to diagnose the early case. There had been increased co-operation between the general medical practitioner and the tuberculosis expert. It was no use getting the middle or the final cases; and they could not get the early cases unless a full-time tuberculosis officer was appointed. On venereal disease Mr. Chamberlain had said little. He had referred to the diminution in cases of ophthalmia neonatorum, but that was simply an example of the extra care now being taken. He did not mention how many of the 5,000 were blind, but with ordinary care and attention there should not be a single case of ophthalmia neonatorum. He hoped Mr. Chamberlain would exercise all the moral and administrative pressure he could in regard to this disease.

Dr. Davies remarked that during the last four and a half years the health of the country had improved, the social services had advanced, and Mr. Chamberlain, with Sir Kingsley Wood, had earned admiration and respect from the medical profession. If Mr. Chamberlain had become a member of that profession he would have risen to great heights. He concluded by criticizing an item of the vote. Under the heading "Medical staff (including Government lymph establishment)" there were forty medical officers. Of these, two were in receipt of pensions of £100 and £460 respectively per annum from Indian funds; one of a pension from Nigeria and Gold Coast funds to bring his total emoluments up to £1,305, and two of army retired pay of £365 and £510 per annum respectively. Were there no medical men in this country fit for these offices without taking retired officers from the Indian Medical Service? It was essential, particularly in the national health insurance service, that a man who had a chance of working up from general practitioner to a higher administrative office should not be pushed on one side and the job given to another man from another service. There was probably good reason for these appointments, but Dr. Davies said he would be glad to know what it was.

Miss LAWRENCE, [illegible] Chamberlain's tightening up of Poor Law [illegible] criticized Mr. Ch[illegible] refusal of out-relief to single able-bodied young men drove them on [illegible] to the roads and to casual wards, which had all the evils of the old [illegible] mixed prisons.

Captain FRASER said there were about [illegible] 48,000 blind persons in England and Wales, of whom 11,000 were [illegible] under the age of 40. About 10,000 were unemployed, and 33,000 characterized as unemployable. The amount of blindness had decreased, but there had been an increase in the registered cases, partly through the Act passed in 1926 giving blind persons free wireless licences. In London alone 900 blind persons previously unregistered had been discovered through that Act. Last year 17,000 blind persons over the age of 50 received State pensions at a cost of about £450,000, and grants from the Ministry for the welfare and employment of the blind £126,000. In 1928 the local authorities must have spent about £225,000 on the welfare of the blind. Between 1924 and 1928 expenditure on the blind from public funds had gone up by about 68 per cent. This country had a more carefully worked out, systematic, and widespread method of helping the blind than any other in the world. The time had come to go further. The inquiry by the Minister's advisory committee into the condition of unemployable blind persons must be nearing completion. Whatever was done they should not extinguish private charity and voluntary effort. Turning to the question of cancer, he remarked that the country needed a central institution where sufficient cases could be gathered together to provide statistics on experiments and treatment—an institution comparable to those established in France, in Sweden, and in Berlin.

Mr. LANSBURY said no House of Commons had tackled the cause of health problems—the poverty which caused people to be sick, murdered the mothers at childbirth, and caused consumption. If Dr. Fremantle were to speak in that debate he would have to say that after the Ministry of Health and the local authorities had done all they could for phthisical cases, they sent them back to the same slums, again to fall victims to the disease. The reason consumption increased was poverty, imposed by social conditions.

Dr. DAVIES: Not always.

Mr. LANSBURY retorted that doctors, especially those having anything to do with the public health, knew the diseases with which they dealt were due in the main to bad housing, low wages, unemployment, casual labour, and all that went to produce poverty. He thanked God he was not a medical man or an expert, but he knew that most of the children attending schools for mental defectives came from homes which suffered from poverty—the same homes from which the phthisical cases came. Worry and the struggle for a living caused in pregnant women the things which brought about mental deficiency in the child when it was born. Before the doctors started telling the multitude those whom they were going to pick out for sterilization, let them take care that the multitude did not sterilize the whole lot of doctors first.

Sir KINGSLEY WOOD said he would reply privately to the point raised by Dr. Davies about the appointment of medical officers under the Ministry. He would be able to satisfy him that the medical men whom he had cited had special knowledge of particular sides of the Ministry's work. One was a doctor from the Indian Medical Service with special knowledge of malaria and kindred diseases. The rest of Sir Kingsley's reply, except for a reference to the Ministry's work for the blind, was confined to a defence of the department's housing policy.

The debate was then interrupted for private business. Later Mr. Greenwood's amendment was rejected without a division, and the House agreed to the estimates for the Ministry of Health.

Estimates for Agriculture.

The House of Commons, on May 2nd, went into committee on estimates for the Ministry of Agriculture, including estimated grants for the eradication of tuberculosis in cattle. Introducing these estimates, Mr. GUINNESS said he had not had a previous opportunity for three years to explain the agricultural estimates in detail. He said milk production had been one of the encouraging sides of agriculture in these years of difficulty. The House knew of the result of recent experiments in regard to the health of school children who were fed on milk, and a good deal had been done to encourage the demand, but consumption remained far below what it was in foreign countries, and far below what it ought to be in this country. The Ministry believed the best way to encourage the consumption of milk was to reassure the public on the purity of the milk supplies. The industry had done much itself in that direction, and the Government a good deal by clean milk competitions. Distributors in London, Birmingham, and elsewhere were giving special payments for high quality and cleanliness of milk. The Diseases of Animals Act, passed in 1925, enabled the Government to give compensation for cows slaughtered on account of certain forms of tuberculosis. Between September, 1925, and the end of 1928 700,000 cows were examined. These cows and heifers were not taken at random, but were cases in which the milk had been found to be impure or in which notification had been given by the local sanitary or veterinary authorities, or by the farmers themselves. Of these suspected cows, 8.4 per cent. were found to be affected with scheduled forms of tuberculosis, but only 1.3 per cent. were giving tuberculous milk or suffered from tuberculosis of the udder. Figures and alleged facts had been

published about this investigation which were misleading. He thought the figures were very satisfactory and gave ground for increased public confidence in the purity of the milk supplies. Mr. Guinness went on to say that the Ministry of Agriculture was also trying to reduce the farmers' losses through foot-and-mouth disease. There had been a steady reduction in the number of outbreaks. In 1924 there were 1,404; in 1928 138. In the first three months of 1929 there were 20 outbreaks, but none since March 24th, and when he spoke the country was clear. The disease continued to rage on the Continent. Last year Holland had 19,700 outbreaks and France 11,000. British organization for dealing with the problem was now nearly perfect. There was greater vigilance on the part of the farmers. The embargo imposed in 1926 on the import of Continental meat was immediately followed by a large drop in the number of outbreaks. Drastic arrangements had been negotiated in South America to see that no animal infected by foot-and-mouth disease or in the incubation period of that disease could reach the killing floor for export to Great Britain. A delegation, including two members of the House, had recently visited the Argentine and reported that the South American States were doing all they could to prevent the export of infected carcasses to this country. A fifth precaution enforced by the Ministry of Agriculture was the boiling of swill.

Mr. R. J. RUSSELL protested against the application to cream of the Order issued by the Minister of Health against preservatives in food. In one dairy there had as a result been a shrinkage of over £1,000 a month in the demand for cream. As a result of the Order the use and preparation of synthetic cream had grown up throughout the country. The dairying industry was not satisfied with what the Ministry of Agriculture was doing about tuberculosis, infective abortion, and Johne's disease. What was being done about the unhealthy cowsheds found throughout the country, whose condition was a menace not only to the cow but to the cowman?

Answering Mr. Russell's complaint about cream, Mr. GUINNESS said the matter must be left to the Minister of Health. Medical authorities said that small doses of boric acid were likely to produce a form of disease in some people, so the agriculturist must not weigh his own convenience against the public health. A man who treated his cream on modern lines was well able to carry on without boric acid, and the forbidding of that preservative would be as much for the benefit of the cream producer as it had been in the case of the milk producer. Personally, he deplored the production of reconstituted cream, of which the raw material was a waste product from specialized agricultural industries in other parts of the world. If the public chose this stuff instead of cream they could not be prevented. There had been many complaints that local authorities were unduly severe about cowsheds, but there had been no real grievance. Experience had shown that clean milk could be produced in very poor buildings. The men and their methods mattered much more than the cowsheds.

The House then agreed to the estimate.

The London Lock Hospital.

In the House of Commons, on April 30th, on the motion for the adjournment,

Mr. PETHICK-LAWRENCE called attention to the management of the London Lock Hospital. He said that the Minister of Health had admitted, in reply to questions, that the report of the committee of inquiry showed that changes in the management of the hospital were desirable. Mr. Chamberlain, however, had refused to publish the committee's report, and had stated that the board of the hospital was making considerable changes. In his (Mr. Pethick-Lawrence's) view reforms at the hospital could not be carried out except by a reconstituted board of management and a change in the personnel of the hospital staff. It was ten years since the action of the board was first called into question, and all that time the board had made no important changes. The promises of the board were not good enough.

Mr. CHAMBERLAIN said he wished to remind the House that this was a voluntary hospital. It was not an institution over which he had any authority by law, and he only came into the matter because, in consequence of publicity which had been given to the charges made against the board, the board requested him, as an impartial and independent person, to appoint a small committee to inquire into the charges. In asking for that inquiry the board made it a condition that it should be a private inquiry, and that the evidence should be treated as private. On that condition the committee was appointed and evidence was given. In no circumstances could the evidence given to the committee be published. Where a private inquiry was held it was certainly not the usual practice to publish a report. He had no personal knowledge of the cases which led to the charges which had been alluded to; his concern was that of a person who desired to see that the interests of the public in London were protected. This hospital, which was the only one of its kind in London, could, if properly conducted, perform a great service, and one which no other institution was capable of performing. He was not concerned with what took place before the inquiry, but only with what had occurred since. Some of the delay which had taken place was due to the fact that the chairman of the board had been in bad health, and had not been able to give continuous attention to the matter. A board faced with recommendations which involved the alteration of the management and of the whole system on which the hospital was run could hardly formulate proposals to carry out those recommendations in one or two meetings. It was reasonable that they should take adequate time to examine thoroughly all possible alternatives. If he felt that the board was not facing up to the situation and was disposed to go on as it had before, and to take no serious account of the important suggestions which had been made in the report, he would not hesitate to publish the report as a means of bringing pressure upon them through public opinion. But he had felt all along that that was a course which he ought not to take unless he felt convinced that it was really necessary to bring about the results desired. The report, after all, did not charge the members of the board with any moral obliquity or any dishonesty or any financial irregularity, but it certainly did indicate that the administration of the board, in parts, might well be improved. The publication of the report would draw public attention to the hospital in a way which could hardly fail to have a serious effect upon its working. The first result must inevitably be a reduction in the public contributions to the hospital, which had already suffered to some extent. The public discussion of the report would present difficulties to the board in obtaining the services of the staff—not merely of the medical staff, but particularly of the nursing staff. He had good reason to suppose that the reconstitution of the board formed a part of the proposals which he expected to have in his possession before long. If the report was published also it would be difficult to secure the men and women to form the reconstituted board, whose presence might give confidence to the public. He had in contemplation some further steps which he did not feel at liberty to discuss in public, but which might assist towards a satisfactory solution. Nothing had occurred up to the present to justify him in publishing the report. He still reserved to himself the right to publish the report if he was not satisfied that the administration of the hospital was going to be reformed in the way he thought it should be. He felt confident that the board desired to reform itself and its administration, and he was confident that it would succeed.

Bills.

On May 6th the Mount Vernon Hospital Bill was read the third time by the House of Commons and passed, with amendments.

The House of Lords, on May 7th, went into committee on the Reconstituted Cream Bill. Lord CLINTON moved an amendment to substitute the word "artificial" before the word "cream" instead of the word "reconstituted." This amendment was carried, and the title of the bill was accordingly altered to "The Artificial Cream Bill." The bill passed through committee.

In the House of Commons, on May 7th, the Pharmacy Bill passed through all its stages and was read the third time and passed.

The Infant Life Preservation Bill, which had already passed the Lords and the title of which had been slightly altered by a standing committee of the House of Commons, was read a third time in the Commons on May 2nd, without discussion.

The Hospitals (Relief from Rating) Bill, introduced by Colonel Gretton, is officially described as dropped.

Small-pox.—Lord EUSTACE PERCY said, on May 1st, that no regulation had been issued by the Board of Education giving a local medical officer of health the right to exclude healthy unvaccinated children from school. In an answer to Dr. Fremantle, on May 2nd, Mr. CHAMBERLAIN said that of the seven deaths from small-pox among the passengers and crew of the *Tuscania*, three were of persons who had not been vaccinated and four of persons vaccinated only in infancy. Two of the former were vaccinated and three of the latter revaccinated during the incubation period. The ages of the persons who had been vaccinated in infancy ranged from 28 to 37 years. Answering Mr. Malone on the same date, Mr. Chamberlain said he was advised that in ordinary circumstances it was unnecessary for small-pox contacts to refrain from following their occupations if they were subject to regular medical supervision during the incubation period. It was not the practice of the Ministry of Health to sanction the payment of compensation except in cases where it was necessary for the protection of public health that the contacts should abstain from work. He knew that certain boroughs where his sanction was not required had made payments to contact cases. Sir JOHN GILMOUR said, on May 2nd, that the medical officer of health for Glasgow had issued certificates to all members of the crew of the *Tuscania* within his area, stating that they had been under observation for the quarantine period of the disease, and that they were now free from infection so far as that source was concerned.

Ministry of Pensions.—Major TRYON stated, on May 2nd, that institutions in charge of the Ministry of Pensions had on March 31st, 1929, 11,785 in-patients, including 6,000 mental patients. For out-patient treatment 2,688 cases were in attendance. These figures were lower than the corresponding figures on January 1st, 1928, by 1,360 in-patients and 2,142 out-patients.

Notes in Brief.

In the metropolitan police district during the first quarter of 1929 3,651 motorists were prosecuted for causing undue noise.

During 1928 the deaths of 667 males and 421 females in England and Wales were classified as suicides from gaseous poisoning.

In the Ministry of Health 3,592 persons are employed on the administration of the National Health Insurance and Contributory Pensions Acts.

In 1928 71,200 lb. of medical opium were exported from India to the United Kingdom.

Obituary.

HERBERT JONES, L.R.C.S.I., D.P.H.,

Late Medical Officer of Health for the Herefordshire Combined Districts.

WE have to announce with great regret the death, on May 1st, at Welwyn Heath, of Dr. Herbert Jones, who was for many years a leading figure in the public health service and a recognized authority on medical administration under the Local Government Acts.

Herbert Jones was born in 1858 and received his medical education at the Middlesex Hospital, whence he qualified as L.S.A. in 1886, subsequently obtaining the diplomas of L.R.C.S.I., L.M., and L.A.H.Dub., and the D.P.H.Camb. in 1892. After some years in general practice at Shipley he was appointed in 1893 medical officer of health for the borough of Crewe, and from 1898 to 1900 held the corresponding post under the Rhondda Urban District Council. He then went to Hereford as medical officer of health and school medical officer for the Herefordshire combined districts and Bromyard urban district. During his twenty-five years' residence in Hereford Herbert Jones rendered great services to the local profession and endeared himself to all his colleagues. As medical officer of health his relations with the practitioners in his district were always most cordial, and he was ever ready to assist them in any case of anxiety or doubt. He was largely instrumental also in resuscitating the Herefordshire Medical Society, and acted as its honorary secretary for many years.

Photo by J. Russell and Sons, London.

Both locally and at headquarters the British Medical Association owed much to Herbert Jones. From 1903 to 1908, and again in 1922 to 1924, he was honorary secretary of the Hereford Division, and held office as chairman in 1913. He had also been honorary secretary and president of the Worcester and Hereford Branch. He served on the central Council of the Association for two terms, and was a valued member of the Public Health and Insurance Acts Committees: he served as chairman of the Superannuation Subcommittee, and did much good work on the Joint Committee on Minimum Salaries for Public Appointments. When the Association held its Annual Meeting in London in 1910 he was vice-president of the Section of State Medicine, and in 1924 at Bradford he presided over the Section of Public Medicine and Industrial Diseases. He was long an active member also of the Society of Medical Officers of Health, on whose council he served for more than twenty-five years; he was elected president in 1914 and for a short time acted as editor of *Public Health*. Both in the Association and in the society he was the chief mover in the fight for security of tenure and superannuation for medical men holding public appointments. Herbert Jones's disinterested work in this and many other professional affairs was of the greatest help, not only to his own district, but to the profession throughout the country. Few men were more intimately acquainted with the intricacies of public health law and administration, and his knowledge was always at the disposal of inquirers. For several years after the introduction of medical benefit under the Insurance Act he was a member of the Hereford Local Medical and Panel Committee, where his sane views and wide knowledge were highly appreciated. Thus it was only fitting that when ill health compelled him to retire from active work three years ago a testimonial was raised on the initiative of the Herefordshire Medical Society, in acknowledgement of his great services to his colleagues in that county and to the profession at large.

Soon after the outbreak of war in August, 1914, Herbert Jones was given command of the Territorial Mounted Field Ambulance attached to the Welsh Territorial Division, with the rank of lieutenant-colonel R.A.M.C.(T.), and later in the war he served in Ireland until his health broke down. His many other activities included the honorary secretaryship of the Herefordshire Branch of the National Association for the Prevention of Consumption, and long service as examiner for the Royal Sanitary Institute and the St. John Ambulance Association. He was the author of small books on school hygiene and on the elements of sanitary science, and wrote a number of papers on such subjects as back-to-back houses, isolation hospitals, and the reform of the public health service. For many years he gave ungrudging help in public health matters to the *British Medical Journal*; he was always willing to answer questions from correspondents, and regularly supplied notes on items of general interest in the reports of his colleagues in the health service.

At the funeral service on May 3rd the Council of the British Medical Association was represented by Dr. C. Courtenay Lord, Assistant Medical Secretary.

Dr. E. H. SNELL, medical officer of health for Coventry, writes:

It may be difficult to appraise at their full value the services which Herbert Jones rendered to the medical profession. For some years, through ill health, he has had to withdraw himself from the active arena of medical politics; and there have been few whose withdrawal has been more missed by those who appreciated the valuable services he had rendered. Herbert Jones was a medical man first and a medical officer of health afterwards, and he appreciated to the full that both branches of the profession could render their fullest services to the community by working in harmony. That he was successful in securing the confidence of both is borne out by the positions of honour accorded to him in the British Medical Association and in the Society of Medical Officers of Health. For many years, before what may perhaps be called the "entente cordiale" between these two bodies, he was a member of the Public Health Committee of the British Medical Association, and there he devoted much energy towards forwarding two objects that he had made peculiarly his own—namely, security of tenure and superannuation for medical officers of health. He was successful in inducing the Association to promote bills in Parliament towards these ends; these bills were not successful, but they broke the ground, and he lived to see both of these objects attained to a considerable extent and with a fair promise of complete attainment in the near future, though unfortunately he himself derived no benefit.

For his colleagues Herbert Jones was an "intelligence officer" and was accepted as the historian of his generation. This resulted naturally from his methodical habits. He docketed and he indexed everything that might be of future interest. And he came to be regarded as the natural reservoir for information on forgotten minutiæ. Holding, as he did in his latter active years, a post in a combined sanitary district, he met the difficulties inherent in such a post with a due regard to the dignity and the rights of the medical man. In August, 1908, Herbert Jones was appointed medical officer of health and school medical officer to the county of Hereford; it then emerged that a condition of the appointment was that all qualified medical assistance required should be provided not, as is invariably the case, by the council, but by the medical officer of health. After some months of negotiation Herbert Jones withdrew from the position.

Having had the privilege of an intimate personal friendship with Herbert Jones for over thirty years, I am able to say that I highly regarded that friendship. He was a true and trusty friend; his ideals made him that: he was not in search of limelight; he was out to serve his day and generation. And few have left such a record of unselfish devotion to the causes of right which he upheld.

HENRY RUTHERFURD, M.B., C.M., F.R.F.P.S.GLAS.,

Consulting Surgeon to the Glasgow Royal Infirmary.

WE regret to record the death of Mr. Henry Rutherfurd, which took place, in his sixty-ninth year, at his residence in Glasgow, on April 14th, after a short illness.

Henry Rutherfurd was educated at the old High School of Glasgow and in the University. He graduated M.A. in 1881, and M.B., C.M., with distinction, in 1884. He held *house appointments in the Western Infirmary under the* late Sir William Gairdner and the late Sir Hector Cameron, and it is probable that the influence of the latter played a large part in moulding his future surgical career. He maintained an intimate friendship with Sir Hector Cameron to the end of his chief's life. After visiting the Continental schools of Jena and Vienna he returned to Glasgow to join the staff of the late Professor Coats as demonstrator in pathology. He held various junior surgical posts, and then became extra surgeon to the Royal Hospital for Sick Children. In 1906 he was appointed surgeon to the Royal Infirmary of Glasgow, holding that position till 1921, when he became consulting surgeon; shortly afterwards he joined the board of managers as one of the three members appointed by the Royal Faculty of Physicians and Surgeons. He was also surgeon to the Royal Cancer Hospital, Glasgow, where he early recognized the potentialities of radium as a curative agent, and encouraged the younger members of the staff to carry out original research. He became a Fellow of the Royal Faculty of Physicians and Surgeons of Glasgow in 1890, and filled various offices, being a councillor, an examiner, and a representative on the Conjoint Board.

Rutherfurd was very happy in his work in the Royal Infirmary, devoting far more time than was commonly allotted to such public work. He had an extraordinarily accurate and full knowledge of the science of surgery, and was renowned for his interest in surgical pathology. His contributions to surgical literature were comparatively few. In his earlier surgical career, in 1898, he was one of the editors of three volumes of *Glasgow Hospital Reports*, to which he contributed two excellent monographs on the "Management of rupture of the urethra" and "Tumours in the sacro-coccygeal region." Other papers were "Nephrectomy for transverse rupture," "Downward dislocation of the patella," and "Irreducible intussusception in the infant."

Rutherfurd was a man of interesting personality, though not a fluent speaker; indeed, his speech was well known for its staccato jerky style; but it was remarked that when he did speak—as for example, in meetings of the Royal Faculty—every word could have been taken down verbatim and not a single phrase or word would have required to be corrected. He was a man of keen wit, with a kindly but not cynical eye for his fellow men. He volunteered for foreign service during the war at the age of 56, and was attached to a hospital in Salonika, with Serbian soldiers as patients. He had the highest sense of honour, with no thought of personal advancement behind any of his actions. To this he added a gift for friendship, and there are many of his time in Glasgow who feel sorely grieved by the loss of Harry Rutherfurd.

A colleague (G. T. M.) writes:

To those of us who were privileged to know and work with Mr. Henry Rutherfurd his death comes as a personal loss, and there must be many of his former students and house-surgeons who will recall their time with him in the Royal Infirmary. A man of wide culture, full of historical and classical knowledge, his conversation during a ward visit might begin with the ancient Persian wars and end on the correct interpretation of a sonnet of Keats. It was, perhaps, this wide knowledge that was responsible for the clarity of thought and the almost whimsical outlook on people and things which were typical of him. Well versed in the surgical literature of the day, he had a humorous eye for the gusty theories which enliven or entwine the surgical wayfarer, and his advice was always to trust clinical experience before anything. His ward journals must have been models of what records should be, and his meticulous care in dealing with patients was, at times, the despair of a house-surgeon with a golf appointment. Beneath his reserve one found a simple kindly gentleman of the old school, with a wide knowledge of men and things, an honesty of thought and directness of speech which expressed itself sometimes forcibly but always fairly, and a very high sense of duty.

WILLIAM McCONNELL WANKLYN, M.R.C.S., L.R.C.P., D.P.H.,

Consultant in Diagnosis of Small-pox, London, Middlesex, and Essex County Councils.

WE deeply regret to record the death, in his sixty-third year, of Dr. W. McConnell Wanklyn, which occurred suddenly at the County Hall, London, on April 30th.

William McConnell Wanklyn received his early education at St. Paul's College, Stony Stratford, later proceeding to Cambridge, where he graduated in arts in 1888. He pursued his medical studies at the Middlesex Hospital, Edinburgh, and Vienna, qualifying M.R.C.S., L.R.C.P. in 1893, and in 1904 obtaining the Diploma of Public Health of the Royal College of Surgeons, London.

We are indebted to a colleague (C. J. T.) for the following appreciation and account of his career:

The loss of Wanklyn at any time during the past twenty-five years would have been a calamity to the community. It is doubly so at this time when the metropolitan area is at last invaded by small-pox of the type which has been so unpleasantly prevalent during the past five years in some parts of provincial England. It is not too much to say that it was largely due to Wanklyn *that London* enjoyed complete freedom from spread of the disease for a whole quarter of a century—from 1902 to 1927. He was the first line of defence, and his services as a super-diagnostician were sought not only in the metropolitan area itself, but by the authorities of Greater London and by those still further afield.

In diagnosis Wanklyn was superb. How many times have his colleagues called him in to decide the character of a rash which in appearance puzzled them hopelessly, and how many times have they been abashed in his presence by the simplicity the case presented immediately he had summed up the salient features! His brilliance in diagnosis had its foundation in his orderliness of mind: the facts of the case were marshalled in their proper order, the weighty ones first, the secondary ones—by undue attention to which mistakes and doubts invariably arise—relegated to their proper position; and under his masterly guidance the case seemed to alter its character before one's eyes until it almost seemed that the rash arranged itself to spell the diagnosis and shouted its name aloud. His rare gifts of mind were exhibited almost equally in tracing the contacts of a case. His method was strongly reminiscent of the method of reconstruction of the crime followed by the French detective force. His mind, indeed, resembled in its pure logical quality a French rather than an English type.

His first experience in medical practice was obtained in various institutions of the Metropolitan Asylums Board, amongst which he assisted at the Hospital Ship, the Gore Farm, and the Brook Hospital, and thus gained a wide practical acquaintance with various types of infectious diseases. At the Hospital Ship he came under the tuition and influence of Ricketts, and throughout his official life Wanklyn never wearied of bearing testimony to the remarkable talents of his teacher, talents which he himself assimilated and brought to further fruition.

The outbreak of small-pox which occurred at the beginning of this century found Wanklyn in the position of medical superintendent of the River Ambulance Service (1901–3) and referee in diagnosis of small-pox to the Metropolitan Asylums Board. In September, 1903, he entered the institutional service of the London County Council and was stationed at the Heath Asylum, Bexley. His service there, however, was interrupted for a period of six months from the following April, when Sir Shirley Murphy brought him to St. Martin's Place to carry out special duties in reference to small-pox. It was during this period that his true mission in life dawned upon Wanklyn, and during this year (1904) he prepared himself for entrance to the public health service proper by taking

his Diploma in Public Health. After a brief return to institutional life in November, 1904, he was finally appointed assistant medical officer in the Public Health Department of the London County Council on February 28th, 1905, from which date he carried on, against a menace ever present to an imperfectly vaccinated community, a magnificent struggle which ended only with his death.

On the outbreak of war Wanklyn immediately took up military duties, and from September, 1914, to January, 1919, served with the rank of captain in the R.A.M.C.(T.F.) during which period he served in France for one year and eight months.

Wanklyn was naturally intensely concerned with propaganda for vaccination, to which he devoted much of his official life, and to this propaganda he turned again on his return to civil life. In 1921 he delivered the Emeritus Address No. 3 upon "The abolition of small-pox in the British Isles as the next step in the medical advancement of England's industrial health and efficiency," while a little pamphlet he wrote entitled *Facts that you ought to know about Small-pox and Vaccination* has run into several editions. His literary *chef d'œuvre*, however, is the manual *The Accurate Diagnosis of Small-pox*, published in 1923. This book enshrines those qualities of lucid and logical exposition which made Wanklyn in his own sphere truly great. No practitioner at this time when small-pox threatens to become prevalent throughout Britain can afford to be without a copy of this, the clearest guide to the diagnosis of small-pox that exists.

The recent extension to London of the mild type of disease, together with the need of strenuous effort to prevent the complication of the situation by invasion by the more deadly type from the East, no doubt put a great strain upon Wanklyn, but no one anticipated his sudden and tragic death in harness.

Dr. R. KINA BROWN, late medical officer of health for Bermondsey, writes:

I had the good fortune to make Dr. Wanklyn's acquaintance during the small-pox epidemic of 1901–2, when he had charge of the South Wharf of the Metropolitan Asylums Board, which is situated in the borough of Bermondsey, and when I was medical officer of health for that borough. The friendship formed then lasted up to the day of his death, which came as a great shock to me as well as to his many friends. His knowledge of the early diagnosis of small-pox was unrivalled, and I learned lessons in the disease from him which proved invaluable to me during the (almost) twenty-eight years of my tenure of office in Bermondsey. He was a perfect type of a cultured English gentleman, and worked most unselfishly for the good of his fellow countrymen in season and out of season. He was indeed most enthusiastic and thorough in whatever subject he took up, and will be sorely missed by his numerous friends. Enemies he had none, and I cannot even imagine him having had any. His life was not in vain, for his works will survive, and be an incentive to many of the younger generation.

We regret to announce the death of Dr. WILLIAM KINNEAR, on March 30th, at his residence in Dundee, after a short illness following several years of impaired health. He was born in Dundee in 1863, and received his medical education at Edinburgh, where he graduated M.B., C.M. in 1888, and proceeded M.D. in 1901. Shortly afterwards he returned to Dundee, and soon built up an extensive practice, winning general esteem and affection. He had been an active member of the Dundee Branch of the British Medical Association, and a former vice-president; he had also been president of the Dundee Medical Club and of the Forfar Medical Association. He was medical officer to the Bearer Company, 3rd B.B.R.H. (Dundee Highlanders). At the inception of the Territorial Force he was appointed to raise the 3rd Highland Field Ambulance; he later became A.D.M.S. to the 51st Highland Division, and held the rank of colonel, and was appointed honorary physician to the King in 1913. When the 51st Division went to France he was retained to organize the medical services of the 64th Division until 1917, when he resigned owing to ill health. He held the V.D. for long service, and was an Associate of the Order of St. John of Jerusalem. He is survived by his widow, a daughter, and six sons, of whom two are in practice in Dundee.

The following well-known foreign medical men have recently died: Dr. EMANUEL FORMANEK, professor of chemistry and toxicology at Prague, aged 59; Professor AUGUST HOFFMANN, director of the medical clinic of Düsseldorf Academy, aged 67; Colonel JOHN MOORE BANISTER of Omaha, emeritus professor of tropical medicine at Nebraska University, aged 74; Dr. JAMES MOORES BUE, formerly editor of the *Annals of Ophthalmology*, aged 69; and Dr. THOMAS SAGE, formerly professor of pharmacology and therapeutics of the Detroit College of Medicine and Surgery, aged 59.

ROBERT EDWARD SARE, manager of the *Lancet*, died last week in his 51st year, after a long illness. Mr. Sare first joined the staff of Messrs. Hodder and Stoughton in 1904; three years later he became manager of the Oxford Medical Publications, and in 1920 was appointed manager of the *Lancet*, which Hodder and Stoughton had that year acquired from Wakley and Co., Ltd. For twenty-two years his occupation brought him into close relation with many members of the medical profession, and it was his understanding of their point of view, and perhaps the fact that originally he had intended to study medicine, that helped him to carry out the duties of his post with such success. He was a very hard worker, and earned the respect of all his colleagues on both the managerial and literary staffs. We would wish to express our sympathy to the *Lancet* in its loss.

Universities and Colleges.

UNIVERSITY OF LEEDS.

THE degree of M.D. has been awarded to G. R. Baxter.

UNIVERSITY OF DUBLIN.

TRINITY COLLEGE.

AT the first summer commencements held on May 2nd the following degrees in the Faculty of Medicine were conferred:

M.D.—J. R. Craig, W. P. E. M'Intyre.
M.B., B.Ch., B.A.O.—H. Dundon, C. de L. Shortt, P. A. Thornton.

NATIONAL UNIVERSITY OF IRELAND.

AT a meeting of the Senate on May 3rd Dr. D. J. Coffey was reappointed representative of the University on the General Medical Council for a further term of three years.

The following candidates have been approved at the examinations indicated:

D.P.H.—*Part I*: *M. Hanly, *P. Fleming, M. A. Cooney, J. J. L. Cox, R. Dalton, T. Feeney, E. A. Grant, T. J. Kirby, Mary E. McGloughlin, H. Macken, A. B. O'Malley, M. Peppard, P. B. Waldron, E. White. *Part II*: *T. F. Higgins, *J. V. McLoughlin.

* With second-class honours.

The diplomas were conferred upon Dr. T. F. Higgins and Dr. J. V. McLoughlin on the following day.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

LICENCES to practise have been conferred upon the following 43 candidates, who have passed the final examination of the Conjoint Board and have complied with the by-laws of the College:

Dorothy G. Angus, Audrey Z. Baker, W. Y. Bowman, T. D. T. Brock, Hurst, H. H. Brown, G. H. Burk, Mabel J. Cooke, J. R. Crumbie, F. A. T. Edwards, T. C. R. George, D. H. Gibson, P. N. Go[illegible], S. E. F. Gooding, M. Gordon, E. Hacker, E. J. Hamp, Haribans[illegible], W. Heath, H. L. Hoffman, C. E. Holden, R. G. S. Hone, H. F. Hutchinson, G. Lal, R. A. Leader, F. M. Mallinson, F. W. Marshall, R. S. Marya, Jocelyn A. M. Moore, W. R. C. Morris, G. T. E. Parsons, R. S. B. Pearson, A. P. Petigura, Edith M. Redding, C. J. Sander[illegible], W. H. H. Serasinghe, U. P. Sinha, A. El M. Soliman, Mary S. Steed, C. R. Todd, R. L. Whittaker, A. S. Wisfield, B. Wright, R. H. Yorke.

LONDON INTER-COLLEGIATE SCHOLARSHIPS BOARD.

THE London Inter-collegiate Scholarships Board announces that an examination for six medical scholarships and exhibitions, and one dental scholarship, of an aggregate total value of £533, will commence on June 25th. They are tenable at University College and University College Hospital Medical School, the London (Royal Free Hospital) School of Medicine for Women, and the London Hospital Medical College. Full particulars and entry form may be obtained from the secretary of the Board, Mr. S. G. Ranner, M.A., the Medical School, King's College Hospital, Denmark Hill, S.E.5.

Medical News.

THE Glasgow University Club, London, will dine at the Trocadero Restaurant, Piccadilly, on Friday, May 31st, at 7.30 p.m., when the chair will be taken by Emeritus Professor F. O. Bower, D.Sc., F.R.S. Any Glasgow University men who, though not members of the club, desire to attend are requested to communicate with the honorary secretaries, 62, Harley House, N.W.1.

THE annual medical missionary breakfast of the Medical Prayer Union will be held on Wednesday, May 15th, at the Refectory, University College, Gower Street, W.C., at 8 a.m., under the presidency of Dame Mary Scharlieb; an address will be given by Dr. L. E. Sharp of Ruanda, Uganda. Intimation of intention to be present will be welcomed by the honorary secretary, Dr. Tom Jays, Livingstone College, Leyton, E.10.

THE second meeting of the Internationale Gesellschaft für Sexualforschung will be held in the House of the British Medical Association, Tavistock Square, London, from August 3rd to 9th, 1930. It may be assumed that, as was the case in Berlin, the papers presented for discussion will fall into the following groups: biology; physiology, pathology and therapeutics; psychology, pedagogy, ethics, aesthetics, religion; demography, statistics, social and racial hygiene; sociology, ethnology, and folklore. All the arrangements are in the hands of Professor F. A. E. Crew, the University, West Mains Road, Edinburgh, to whom those who are interested are requested to write.

THERE will be a clinical meeting of the London Clinical Society at the London Temperance Hospital on Thursday, May 16th, at 8.30 p.m. All medical practitioners are welcome.

THE next meeting of the Biochemical Society will be held in the Department of Biochemistry, University Museum, Oxford, to-day (Saturday, May 11th), at 3 p.m.

THE Fellowship of Medicine announces that the third and fourth lectures of the M.R.C.P. evening course will be given at the Medical Society's House, 11, Chandos Street, Cavendish Square, at 8.30 p.m.: on May 14th Dr. A. Knyvett Gordon will discuss the clinical significance of the blood film, and on May 17th Dr. Bernard Myers will deal with purpura. A clinical demonstration will be given by Dr. J. R. B. Hern on May 15th, at 4.30 p.m., at the City of London Hospital for Diseases of the Heart and Lungs, and another clinical demonstration will be given by Mr. Cole Marshall on May 17th, at 2.30 p.m., at the Western Ophthalmic Hospital, Adelphi Rooms, 264, Edgware Road, W.2. These demonstrations are free to medical practitioners. A course of four lecture-demonstrations on ante-natal treatment will be given by Professor Dame Louise McIlroy on Fridays, at 5 p.m., at the Royal Free Hospital, starting on May 17th. Tickets can still be taken for the courses in progress at St. John's Hospital and at the Lock Hospital. Courses in June include ophthalmology at the Royal Westminster Ophthalmic Hospital; gynaecology at the Chelsea Hospital: chest diseases at the Victoria Park Hospital; proctology at St. Mark's Hospital; diseases of children at the Children's Clinic; and medicine, surgery, and the specialties at the Prince of Wales's Hospital. More detailed information, syllabuses, and tickets can be obtained from the Secretary of the Fellowship, 1, Wimpole Street, W.1.

DR. DRUMMOND SHIELS, M.P., has been made a member of the committee appointed by the Secretary of State for the Colonies to consider the existing system of appointment in the Colonial Office and in the Public Service of the Dependencies not possessing responsible government.

COLONEL R. J. BLACKHAM, C.B., C.M.G., C.I.E., D.S.O., M.D., who is a member of the City Corporation and clerk to the Worshipful Company of Glaziers, was recently invested as Grand Sword Bearer of the Grand Lodge of Freemasons of England.

DR. ARTHUR R. WELLINGTON, Director of Medical and Sanitary Services, has been appointed an official member of the Legislative Council of the Colony of Hong-Kong.

IN an article published in the *Medizinische Klinik* of April 5th, B. Möllers states that an increase in the general mortality and the influenzal mortality has been reported in the Rhine district and in the greater part of England. In the English large towns with a population of about 20 million there were 2,183 deaths in the week ending March 2nd, or more than twice the number of deaths during the influenza epidemic of 1927. Although the mortality on the Continent was nowhere so serious as in England, the mortality rate in the Rhenish towns is also high at present (Cologne 32, and Elberfeld-Barmen 36 per 1,000), whereas in North Germany and the Scandinavian towns the epidemic was subsiding. The epidemic appeared to be spreading in countries on the Baltic, Czechoslovakia, and Hungary. Holland seemed to be the only country where the epidemic had caused considerable interference with public business.

IN addition to the lists of medical practitioners serving as members of local authorities or their subsidiary public bodies in Great Britain, published in our issues of December 8th (p. 1057), and December 29th, 1928 (p. 1190), and February 16th (p. 314), April 13th (p. 702), and April 27th, 1929 (p. 795), we are informed that Dr. H. D. Brice (Dukinfield) has been a member of the Dukinfield Borough Council for some years and is chairman of the Housing Committee; Dr. Brice is also a Justice of the Peace for the county of Chester. We have also received intimation that Dr. Morgan is a member of the Paddington Borough Council; Dr. C. Fuller is a member of the Marylebone Borough Council, of the Board of Guardians, and of the Metropolitan Asylums Board; and Dr. Burnhill is a member of the Hammersmith Borough Council. Professor Eyre, Mr. H. L. Eason, and Dr. Dreaper are members of the Metropolitan Asylums Board, the last-named being also a member of the Kensington Guardians of the Central Unemployed Body.

THE late Mr. Illtyd Williams of Bournemouth and formerly of Normanby, Yorks, has by his will bequeathed £20,000 to the Imperial Cancer Research Fund, and in the event of an established cure for cancer being found any balance then remaining is to be applied by the Royal College of Surgeons and the Royal College of Physicians for such further investigation into the diseases of man as they may from time to time determine.

IN connexion with the thirteenth International Congress of Ophthalmology at Amsterdam and The Hague, from September 5th to the 13th, committees have been appointed to prepare reports on the following subjects: the examination of visual acuity; perimetry; notation of the cylinder-axis; examination of the light sense; standardization of the visual examination of railwaymen, motor drivers, seamen, and airmen; and uniformity in the programme of ophthalmological studies. The fee for membership of the congress is twenty-five Dutch florins. Members wishing to contribute a paper must give notice not later than June 1st to the secretary of the Editorial Committee of the Congress, Wilhelminagasthuis, Amsterdam, from whom further information may be obtained. A previous reference to this congress appeared in our issue of March 9th (p. 485).

WE have received the first issue of *Röntgenpraxis*, which is to appear twice a month as a supplement to *Fortschritte auf dem Gebiete der Röntgenstrahlen*, the organ of the German Roentgen Society, under the editorship of Professors R. Grashey of Cologne, H. Holfelder of Frankfort, and H. Holthusen of Hamburg. As its subtitle indicates, the journal deals with diagnosis and treatment by *x* rays, radium, and light.

MESSRS. BURROUGHS WELLCOME AND CO.'S West End exhibition rooms have been transferred from 54, Wigmore Street, to more commodious premises at 10, Henrietta Street, Cavendish Square, W.1. Members of the medical and allied professions are invited to inspect the exhibits, which are on view daily from 9 a.m. to 6 p.m.; Saturdays, 9 a.m. to 1 p.m.

WE have received the fifth volume of the publications of the Obstetrical and Gynaecological Clinic of Copenhagen University, edited by Professor S. A. Gammeltoft. The volume consists of 14 papers, most of which have been published elsewhere, seven being in Danish, six in English, and one in German. An appendix contains statistics of the clinic for 1926.

THE sum of 400,000 florins (£34,000) has been placed at the disposal of the University of Utrecht by the trustees of the Rockefeller Foundation for the establishment of a new institute of physiology.

IT has been arranged to hold the second national congress of equatorial medicine at Guayaquil in 1930, under the presidency of Dr. B. Gimez, professor of clinical medicine; the sixth international congress for industrial medicine at Zürich or Geneva in 1931; and the international congress of oto-laryngology in Madrid in 1932.

WE are informed that, as a result of a recent meeting, a body has been constituted under the title of the "Ultra-Violet and Allied Trades Association," consisting of a number of the leading firms engaged in the design, manufacture, and marketing of ultra-violet, physio-therapeutical, and other electro-medical apparatus in this country. The objects of the association are: to promote co-operation between manufacturers with a view to making improvements in apparatus; to provide a medium through which the manufacturers may be taken into consultation by the medical profession on matters of mutual interest; and to form a clearing-house for information on all points affecting the technical and constructional aspects of electrotherapy. The offices of the association are at Kern House, 36, Kingsway, W.C.2.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W.C.1.***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1, on receipt of proofs.

All communications with reference to ADVERTISEMENTS, as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager.

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines).

The ***TELEGRAPHIC ADDRESSES*** are:
EDITOR of the *British Medical Journal, Aitiology Westcent, London.*
FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate Westcent, London.*
MEDICAL SECRETARY, *Mediocera Westcent, London.*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams: *Bacillus, Dublin*; telephone: 62550 Dublin), and of the Scottish Office, 7, Drumsheugh Gardens, Edinburgh (telegrams: *Associate, Edinburgh*; telephone 24361 Edinburgh).

QUERIES AND ANSWERS.

PLATELETS IN CIRCULATING BLOOD.

DR. R. CRAIK (Ealing) writes: In your issue of November 17th, 1928 (p. 913) Dr. Leonard Hill reported an observation of the capillary circulation at the edge of the liver in mice. Dr. J. McQueen confirmed the observation. I should be *greatly obliged if either of these observers would inform me* whether blood platelets were seen in the circulating blood. It is easy to detect platelets in a blood film with 1/3 in. objective.

BULBAR PARALYSIS.

"WM. B." *writes: Can any reader suggest treatment for progressive bulbar paralysis of recent origin?*

INJECTION OF VARICOSE VEINS AFTER PREVIOUS THROMBOSIS.

"MEDICO" asks for advice as to the length of time after a previous *thrombosis which should elapse* before varicose veins in the same leg can be treated by the quinine-urethane method, if, indeed, it is ever safe to do so. He has a patient who had thrombosis of the leg a year ago after an operation; also another patient with superficial thrombosis (localized) of recent development.

PAINFUL HEEL.

"GIZA" writes: A patient of mine complains of "painful heel," the pain being referred to the inner and lower aspect of the right heel. *X*-ray examination has revealed no abnormality of the *os calcis, and no foreign body* was detected. *The pain persists* even when the patient is resting in bed, and on getting out of bed in the morning it becomes acute on putting the heel to the ground. No physical signs are present in the heel, nothing can be felt in the fatty pad, and no swelling can be detected. *I should be very grateful* for advice as to treatment, as I am frankly puzzled. No symptoms of gout are present; the patient's age is 49, and there are no rheumatic tendencies.

AXILLARY HYPERIDROSIS.

DR. J. CURTIS WEBB (Cheltenham) writes: If "D. G." (April 27th, p. 796) will give his patient two or three full pastille doses of *x* rays with medium heavy filter (about 2 mm. Al), *I think he* will cure this distressing complaint. *X* rays have a specially effective action on glandular tissue, and the aim of the treatment is to destroy the sweat glands in this region.

INCOME TAX.

Car Renewals and Depreciation.

"G. S. S." bought a four-seater car in 1924 for £210 and sold it in 1927 for £50, when he bought a two-seater car for £170, being allowed as an expense £160—£50=£110. In March of this year he bought a four-seater car (apparently of a better grade than the first one) for £430, receiving £80 for the second of the three cars. What can he claim (1) as an expense, and (2) by way of depreciation of the new car.

*** The lower capital value of the car equipment of the practice effected in 1927 was merely temporary, and in our opinion "G. S. S." is now entitled to claim by way of renewal cost—that is, as an expense of the year ending March 31st, 1929—£210—£80=£130. The question of the depreciation allowance is more difficult. It is a *definite rule of law that "renewals" and* "depreciation" cannot be claimed simultaneously, and we feel that "G. S. S." will meet with much difficulty if he should, in all the circumstances, seek to establish that the £130 allowance is for "obsolescence" rather than for "renewal." We suggest, therefore, that he might drop any claim to depreciation on the new car for 1929–30, but claim it for 1930–31 and following years. There will be a temporary loss, but that will be put right automatically later on if "G. S. S." *will* make a point of claiming the obsolescence allowance when he replaces his present car.

Occasional Residence in this Country.

"CERONS" inquires whether he is liable for income tax on an annuity payable from Canada to France; *he has* a small income from investments in this country, is married, and lives in his wife's flat for *about* five months of the year.

*** It is not possible to deal very fully with this matter here; much turns on whether or not "Cerons" is liable as a British *resident, and that is determinable* partly by reference to his habits of returning to this country, social and business ties, etc. But on the facts as stated we are of opinion that our correspondent is not liable to account for tax on the annuity, and that tax is not deductible by him therefrom unless the share income is charged by way of security in favour of the annuity.

LETTERS, NOTES, ETC.

PAROXYSMAL TACHYCARDIA.

DR. W. F. LLOYD (Windsor) writes: Paroxysmal tachycardia starts suddenly, and as suddenly ceases, for no apparent reason; it is generally supposed that treatment has no effect on this condition. Yet there is a very easy method of treatment, which in less than a minute causes the heart to resume its natural rhythm. If the *patient is told* to take in a deep breath and retain it as long as possible, in a short time the heart will be found to have resumed its normal rate. Cases of ordinary palpitation may also be cured in this way, but not so certainly. The regular uniform pressure on the pericardium seems to produce this astonishing effect on the heart.

CANE SUGAR IN THERAPEUTICS.

DR. J. CAMERON (Beverley) writes: I observe that Dr. G. S. Barons-feather (May 4th, p. 838) believes there is a special *something* in "cane" sugar not found in "beet" sugar. About a year ago I raised this question *in respect of sweetness, etc., in a newspaper.* I was answered by an expert chemist, who agreed with me that twenty years ago beet sugar was defective, but that to-day beet sugar could not be detected from cane sugar by any chemical or physical test. I quoted the scriptural allusion to *salt* and *savour*; this was readily disposed of by the chemist, and I agreed with him. The colour of Demerara sugar is readily washed off; some say this colour is an added quality. Apparently the "cane" *versus* "beet" *something is a delusion*, or requires explanation.

PROLONGED EMETINE TREATMENT.

DR. F. G. CAWSTON (Durban) writes: A piece of lint moistened with a saturated solution of magnesium sulphate and covered with oiled silk is very gratifying where any local reaction has occurred from an intravenous injection, and may be used to lessen the tenderness which sometimes follows intramuscular injections. In the Indian quarters round Durban whole families of children are sometimes infested with the *bilharzia haematobia*. Children of 8 years tolerate the required dose of intravenous antimonium potassium tartrate very well and are not so liable to cough or vomit as European children, but I am not convinced that any curative treatment can yet be recommended to a little girl, aged 3, whose urine *contains the ova of Schistosoma haematobium* and much blood, or even younger children who likewise suffer from chronic haematuria in the same district. The injurious effects of prolonged administration of emetine have not been fully appreciated. Though the early signs of the accumulative *action of emetine are more* readily detected in the child than they are in an adult, any line of treatment should aim at a complete cure within one month, and the oral administration of any drug would necessitate a longer course of treatment than would be required by injections. By repeating the course of *intramuscular* injections of emetine hydrochloride I have obtained a complete cure in a little European boy, aged 4, but the total dose required is ill defined and heroic at such an age. Although emetine periodide may be recommended as a relatively safe preparation of this drug, it sometimes causes vomiting unless patients are confined to bed and kept on a strict diet, as is to be preferred in the treatment of dysentery, *for which* the drug is more suitable. Since bilharzia infection tends to die out of itself in many cases, it would seem best not to undertake the treatment of very young children who are continually exposed to further infection, and may thus develop a relative immunity to the disease, *until such a time as less toxic and more effective means* of cure are at our disposal. But their presence in the neighbourhood emphasizes the need for more *theoretical* prophylactic measures to avoid the dissemination of the third species of Schistosome worms which attack man in Natal.

VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges and of vacant resident and other appointments at hospitals, will be found at pages 49, 50, 51, 54, 55, 56, and 57 of our advertisement columns, and advertisements as to partnerships, assistantships, *and locumtenencies* at pages 52 and 53.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *191*.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

437. Anaemia in Sprue.

N. H. FAIRLEY, F. P. MACKIE, and H. S. BILLIMORIA (*Indian Journ. Med. Res.*, January, 1929, p. 831) record an analysis of the blood conditions in 67 cases of sprue, in which, in addition to the routine haematological investigations, the van den Bergh reaction was employed to estimate the bilirubin content of the serum, and efforts were made to determine the haemolytic or non-haemolytic nature of the anaemia. Sprue and pernicious anaemia have certain common features, and the salient points of difference between the two diseases are given. At onset sprue anaemia is rarely if ever found to be as severe as in corresponding stages of pernicious anaemia, and during its course a grave grade of anaemia less frequently develops. The red corpuscles averaged 3,242,000, the haemoglobin 65.5 per cent., and the colour index 1.0 for the whole series. The blood picture proved remarkably constant. Anisocytosis was the outstanding feature, especially as regards increase in size, and microcytes were much less in evidence than the larger forms. Poikilocytosis and polychromasia occur, but not so markedly as in pernicious anaemia; nucleated red cells were only rarely seen. In uncomplicated sprue the leucocyte counts were either normal, or there was a leucopenia which was sometimes associated with a relative lymphocytosis. A blood crisis characterized by a rapid and critical fall in the haemoglobin and erythrocytes occurred in certain cases. This condition is generally associated with severe diarrhoea; it terminates fatally without remissions and without the corpuscular regeneration so typical of pernicious anaemia. Price-Jones curves were investigated in 11 cases and closely resembled those in pernicious anaemia. Essentially the anaemia is of the megalocytic type. The van den Bergh readings were low, the mean for the whole series being 0.66 unit. These results, compared with those found in malaria and active pernicious anaemia, show that hyperbilirubinaemia is far more frequent in the two latter diseases. The results also indicate that the anaemia is of the non-haemolytic type. Three stages occur in the evolution of bone-marrow lesions. At the onset the changes are minimal and the anaemia is slight. An intermediate stage, characterized by erythroblastic hyperplasia of the red marrow, ensues; and finally a late phase of hypoplasia or actual aplasia of the marrow is seen. These changes are fully described in a paper on the morbid anatomy of sprue by Mackie and Fairley (ibid., p. 799). Deficient blood production rather than excessive blood loss constitutes the basis of sprue anaemia. The authors consider that the trouble originates in an ill-nourished bone marrow which, poisoned by sprue toxin of alimentary origin, undergoes primary hypertrophy and secondary atrophy. In the causation of the latter state toxins produced by a changed intestinal flora and secondary bacterial invaders may play a part.

438. Pulsus Alternans.

C. LAUBRY and D. ROUTIER (*Rev. de Méd.*, 1929, No. 1, p. 11) adopt Traube's definition of alternation of the pulse or heart as the regular succession of weak and strong pulsations, either equidistant from one another or the weak slightly nearer the following strong one; they assert that cardiac and pulse alternations are not necessarily related. The various methods of pulse and heart examination and the findings (sphygmograms and cardiograms) obtainable by mechanical means are discussed, and the clinical varieties of alternating pulse with their diagnosis are enumerated. Various theories as to the pathogeny of pulsus alternans are criticized—namely, the alternating total hyposystolic theory of Wenckebach (since said to have been abandoned by him) and the theory of Gaskell-Hering of partial asystole. The authors incline to the view that the alternation is due to disturbances of the circulatory dynamics; they think that pulsus alternans is a function of transient irregularities of rhythm, arterial tension, and frequency, and is the expression of an alternation of volume of the cardiac wave caused by circulatory factors independently of the force of the heart. This theory of the haemodynamic etiology of the condition is supported by the experiments of Magnus, de Heer, and de Boer. It recognizes the action of the extra-systole and arterial tension on alternation, and explains the clinical circumstances of its appearance in arterial hypertension, in the arterio-sclerosis and atheroma of old age, and especially in paroxysmal tachycardia, when cardiac insufficiency is absent or but slightly marked. By it the discordance between the behaviour of the pulse and cardiac tracings is explained. It does not exclude the phenomena of contractility, nor does it impose an arbitrary conclusion of cardiac insufficiency. The prognosis in these cases is not necessarily unfavourable and depends greatly on the cause, the danger lying less in the alternation than in the hypertension, or causes which keep it up, or its complications. Hence treatment should be directed to the cause. If haemodynamic conditions (pressure, frequency) are present, sedatives such as gardenal, quinine, and valerian act better than any other drugs. If insufficiency predominates, cardiac tonics are indicated. Digitalis, despite its alternogenic power, has remarkable effects; given in large doses it causes disappearance of the alternation by slowing the cardiac rhythm.

439. Diagnosis of Abdominal Aortitis.

B. THEODORESCO and I. DANIEL (*Arch. des Mal. du Cœur, des Vaisseaux et du Sang*, March, 1929, p. 172) do not agree with some writers that the diagnosis of abdominal aortitis is comparatively easy; often it can be inferred only from the coexistence of thoracic aortitis. Skiagrams are less reliable in abdominal aortitis by reason of the deep position of the vessel and its close proximity to the vertebral column. The authors describe the case of a man, aged 35, who had a chancre in 1915. When serving in the army in 1917 he broke down under training and was invalided on account of pain in the right hypochondrium and epigastric pulsation. In 1918 occasional oedema of the legs appeared; this subsided with rest and cardiac tonics. The patient began to suffer from anginal precordial pain, with return of pain in the epigastrium and right hypochondrium, now radiating to the back and the cardiac region, accompanied by dyspnoea, which became worse at night. The heart was slightly dilated, with a loud rough aortic systolic and apical diastolic murmurs; the latter was conducted to the left axilla. The abdominal aorta and left iliac artery were distinctly palpable, hard, and tender. The patient could obtain some relief by pressing the epigastrium against the edge of the bed, but manual pressure over the aorta would produce an anginal attack. At one time these attacks recurred almost daily, but were relieved invariably by amyl nitrite. The paroxysms became less frequent, and finally disappeared. The authors remark that the origin of the precordial pain might be a sudden distension of the left ventricle due to sudden rise of blood pressure produced by compression of the abdominal aorta, or possibly the pain was caused by a peri-aortic neuritis.

440. Primary Pseudo-rheumatic Infections.

ACCORDING to P. LE NOIR and R. LIÉGE (*Ann. de Méd.*, February, 1929, p. 140), Bouillaud first noted the distinction between acute articular and infectious pseudo-rheumatism, and Bouchard was the first to recognize that all infectious diseases were capable of being accompanied by articular manifestations. In the majority of cases these pseudo-rheumatisms can be traced to their real cause, but in other cases the articular manifestations are of such intensity as to mask the diagnosis till other symptoms appear; in still other cases these symptoms do not appear, and the pseudo-rheumatism sums up the whole disease. Among the numerous organisms capable of causing these articular manifestations four occur with particular frequency: the meningococcus, the streptococcus, and the bacilli of Eberth and Koch. Netter and others have noted the frequency of arthropathies during the course of cerebro-spinal meningitis and other meningococcal infections. These arthropathies can attack all the joints; they may be localized in one or several joints, and are most often accompanied by swelling and pain on movement, and sometimes by more intense inflammatory symptoms due to an effusion in which meningococci are to be found. Arthropathies can equally constitute the first objective symptom of a typhoid septicaemia. In these cases the number of joints affected varies; some may be simply painful, while others are swollen, red, and hot. The articular symptoms noted at the commencement of streptococcal septicaemia are more curious, and in these conditions the port of entry of the organism is sometimes not apparent. Primary tuberculous rheumatism has been noted by Mornet, Bezançon, and other observers. Among other infections, such as the pneumococcal or enterococcal, Laggrifoul and Roger have noted pseudo-rheumatism due to *B. melitensis* in a case of undulant fever. The authors believe that in all cases of polyarticular rheumatism the possibility of primary infectious arthropathy should be considered.

441. Amyloid Degeneration of the Kidney.

J. ALVAREZ-SIERRA (*Arch. de med., cir. y esp.*, March 9th, 1929, p. 311) has observed amyloid degeneration of the kidney most frequently in hip disease and ulcerative pulmonary tuberculosis, and then, in order of frequency, in tuberculosis of the vertebrae, knee-joint, intestine, and small joints. Amyloid degeneration is liable to occur after the disease has lasted some time and has been accompanied by profuse expectoration or suppuration. The prognosis, though grave, is not hopeless. It is more serious in the adult than in the child, and less serious in pulmonary than in bone tuberculosis. Contrary to the opinion held by most writers the tuberculous amyloid kidney is seldom recognized, as the clinician's attention is centred on the primary disease. The possibility of amyloid disease should be considered when a tuberculous child shows some oedema and polyuria accompanied by a large amount of albumin and a few renal casts. As regards treatment, a mixed diet consisting of eggs, vegetables, and milk is best. Iodine and iodides, especially those of potassium and iron, are indicated. The author has employed lithium benzoate and the salts of strontium, and found that they produced in some cases a general improvement, and in others a disappearance of the oedema and urinary symptoms.

442. Varicella complicated by Acute Nephritis.

E. R. DENNY and B. M. BAKER, Jun. (*Bull. Johns Hopkins Hosp.*, March, 1929, p. 201), who report an illustrative case, state that since Henoch first described nephritis as a complication of varicella in 1884 only 52 cases have been recorded in the literature. Its rarity is further shown by the fact that it occurred only once in 200 consecutive cases studied by Cassel. It usually appears late in the disease, but it may develop as early as the first week, as in the present authors' case. Their patient was a boy, aged 6, in whom, during the course of haemorrhagic varicella, a mild haemorrhagic nephritis developed, preceded by an acute infection of the tonsils with haemolytic streptococci of the B type. During the acute stage of the nephritis the same organisms were also found in the urine, while after recovery from the nephritis they disappeared from both the throat and the urine. Denny and Baker suggest that the acute haemorrhagic nephritis in this case was not associated with haemorrhagic varicella, but with the streptococcal infection.

443. Prophylaxis against Nocturnal Cramps.

G. GAERTNER (*Wien. klin. Woch.*, February, 1929, p. 211) believes that the nocturnal cramps in the calves and feet of persons who appear to be otherwise healthy, except that some suffer also from varicose veins, are similar in their etiology to the cramps occurring in cholera, severe diarrhoea, and vomiting, and in persons whose occupation entails much sweating; they are attributed to loss of water and the consequent concentration of the blood. Various workers have suggested intravenous injections of isotonic or hypertonic saline for the treatment of the latter kinds of cramp. Gaertner has been able to cure a number of cases of nocturnal cramp by ordering the sufferers to drink a glass of water (or mineral water, lemonade, tea, or milk) at bedtime. If any other liquid is substituted for water it must not have a diuretic, diaphoretic, or aperient action, since the diluent effect on the blood would thereby be neutralized.

Surgery.

444. Treatment of Traumatic Cerebral Compression.

F. W. THOMAS (*Zentralbl. f. Chir.*, March 9th, 1929, p. 586) comments on the increasing employment of intravenous injections of 50 per cent. glucose solution in the treatment of cerebral concussion, compression, haemorrhage, or laceration. Many writers have reported good results. Apparently, osmosis is the mechanism by which increased intracranial pressure and cerebral volume are diminished by hypertonic solutions, either of sodium chloride, Ringer's solution, or glucose. Hypertonic sodium chloride solutions have been abandoned on account of their toxicity; but when considerable cerebral prolapse occurs in cases of trephining a combination of Ringer's solution with 50 per cent. glucose is of great value. Thomas has treated fourteen cases of severe cerebral or cranial injury in men by intravenous injection of 50 per cent. glucose solution; symptoms of commotio cerebri, or cerebral haemorrhage or laceration, were usually relieved in a few days. Although one-fourth of these cases showed little change after this treatment, one patient who had contusion of the chest, fractured ribs and mandible, as well as a fractured skull, with definite signs of pulmonary oedema, rallied quickly after the injection, although previously he appeared to be on the verge of death. Thomas states that this treatment is never dangerous if the correct technique is observed. Regarding the indications for injection of glucose solution, the author was at first very cautious in making use of this treatment, which he reserved for severe cases, slighter cases of cerebral injury receiving the usual treatment by rest and ice-bags. Since, however, the prognosis is always doubtful in these cases, Thomas now employs this treatment whenever operation has revealed the presence of cerebral oedema. He is convinced that it has saved many patients who suffered from various degrees of cerebral laceration, and will prove a most valuable method of combating cerebral oedema and shock conditions.

445. Tannic Acid Treatment of Burns.

F. BEEKMAN (*Arch. of Surg.*, March, 1929, p. 803) gives the result of the treatment of 434 cases of children suffering from burns of second and third degree intensity involving more than 10 per cent. of the surface of the body. Of these, 320 were treated before November, 1925, and 114 after that date. The first group was treated by means of the hot air tent; in some cases paraffin was applied to the wound, and in others sodium bicarbonate baths were given. The patients in the second group were treated by the tannic acid method. In the first group there were 89 deaths and in the second 17, showing a comparative mortality of 27.8 to 14.9 per cent. It was noticed that during the first day the percentage of deaths in each group was the same, but during the second twenty-four hours it rose to 7.2 in the first group and fell rapidly to 0.8 in the group treated with tannic acid, since this method of treatment prevents the absorption of the toxins which are generally the cause of death between the first and third days. The tannic acid treatment produced more rapid healing in second degree burns, and in third degree burns the granulation tissue of the wound was in the most suitable condition for skin-grafting directly after the separation of the tanned eschar. The use of tannic acid decreased the pain caused by the burn. A 5 per cent. solution is used for all parts of the body. Attention is given to early administration of fluids to prevent blood concentration; the most satisfactory method of giving these fluids is by hypodermoclysis of a 5 per cent. dextrose solution. Additional fluids may be supplied by the mouth and rectum, and in twenty-four hours a patient should take at least one litre of fluid for every 25 lb. of body weight. Opiates should be given sparingly, since they diminish the secretions.

446. Ureteral Meatotomy.

H. A. R. KREUTZMANN (*Urol. and Cut. Rev.*, March, 1929, p. 168) states that the operation of cutting the ureteral orifice at its point of entrance into the bladder by scissors, with which fulguration may be associated, is indicated in the following groups of cases in order of frequency: (1) Stones impacted in the lower end of the ureter; (2) destruction of a ureterocele; (3) splitting strictures situated in the intramural portion of the ureter. Stones lodged in the lower third of the ureter are best removed by a combination of meatotomy and the insertion of several ureteral catheters for some distance beyond the stone. The catheters are left in position for twenty-four to forty-eight hours; they are then twisted and pulled out together. In the case of ureteroceles the ureteral orifice is always pin-point in size, and there is a bulging of the lower end of the ureter. The diagnosis of intramural stricture is made by exclusion. In the case of a large tortuous ureter in which the enlargement extends right down to the bladder wall, and no other disease of the urinary tract is demonstrable, intramural stricture must be responsible. The operation consists in slitting the anterior lip of the ureteral orifice with cystoscopic scissors, controlling the bleeding by fulgurating the cut edges, and inserting a filiform catheter into the ureter.

447. Surgical Treatment of Intractable Blepharospasm.

E. S. GURDJIAN and H. W. WILLIAMS (*Journ. Amer. Med. Assoc.*, December 29th, 1928, p. 2053) describe the treatment of three cases of intractable blepharospasm—a closure of the eyelids caused by organic changes in the reflex arc between the trigeminal and the facial nerves. After concluding that the condition was refractory to all ordinary forms of treatment the following procedures were tried. The first method employed was neurectomy of the upper two or three branches of the facial nerve under local anaesthesia in order to weaken the orbicularis oculi by severing most of its nerve supply, but not enough to cause complete palsy as in facial paralysis. In one case treated thus the nerve fibres regenerated and the blepharospasm recurred. The operation was successfully repeated on both sides six months after the first attempt. After the second operation there was no lacrymation and the patient resumed his former

occupation, there being no relapse eight months later. The second method adopted for two patients was the injection of alcohol into the upper branches of the facial nerve. This was not so satisfactory as neurectomy, but although the patients still had occasional attacks of the condition they were much better.

448. Thrombo-angiitis Obliterans.

V. GHIRON (*Arch. Ital. di Chir.*, February, 1929, p. 227) reports six cases of thrombo-angiitis obliterans, and concludes that the disease is much commoner in men (especially in men under the age of 40) than in women. He does not think it occurs more often among Jews. It usually affects the lower limbs, and pain or intermittent claudication are early symptoms. Characteristic signs are the presence of wandering phlebitis, absence of pulse, ischaemia, especially on raising the limb, erythema, hyperaemia, cyanosis, absence of symmetry, and a slow progressive course. Histologically the changes found differ materially from those of arteriosclerosis, being more of an inflammatory nature. On the assumption that hyperadrenalism is a causal factor, Oppel has removed the left suprarenal gland in some cases with apparent benefit. Insulin has also been found useful, the presumption being that the action of the pancreas in some way is antagonistic to that of the suprarenal. Ghiron devised some experiments to test how far adrenaline could cause the symptoms, and concludes that, while not completely accounting for them, it clearly played an important part. Other modes of treating this disease are ligature of a vein to increase stasis in the limb, and extirpation of the sympathetic ganglia of the lower limb. Experiments with nicotine and ergot were negative in respect of producing similar lesions. While the author is convinced that the suprarenal gland plays an important part in the causation of thrombo-angiitis, he does not think it is the sole agent.

449. Cancer of the Small Intestine.

M. MIRANDA GALLINO and M. IRIART (*Arch. Argentinos de enferm. del aparato digest. y de la nutrición*, March, 1929, p. 387), who record a personal case, illustrate the rarity of cancer of the small intestine by the following statistics. Futtle collected 2,432 cases of malignant growths of the intestine; 37 (1.5 per cent.) of these were situated in the ileum, 15 being epithelioma and 22 sarcoma. The combined statistics of Maydl, Nothnagel, Zeemann, Max Müller, F. Müller, and Rueff, amounting to 87,555 necropsies, showed 7,131 cancers, of which 707 were localized in the intestine, and of these 3.1 per cent. were situated in the ileum. The patient of the present authors was a man, aged 62, whose symptoms were recurrent attacks of severe abdominal pain. A diagnosis of obstruction of the large intestine was first made, but *x*-ray examination showed that the obstruction was situated in the lower end of the ileum about a metre above the ileo-caecal valve. At operation a small hard annular tumour was found in the ileum. Resection of the affected intestine, mesentery, and corresponding lymphatic glands was performed, followed by latero-lateral anastomosis. Death from cardiac collapse ensued twenty hours after the operation. The tumour proved to be an epithelioma.

450. Synovectomy in Chronic Arthritis.

N. ALLISON and G. K. COONSE (*Arch. of Surg.*, March, 1929, p. 824) define the function of the synovial membrane as the supplying of a lubricant to the bearing surfaces of a joint; it is also a cooling mechanism for the joint cavity. It contains numerous sensory nerve filaments which endow the joints with sensations of pain and discomfort, and it acts as a barrier to the invasion of infection and toxic agencies. The synovial membrane produces a fluid which is similar to the blood plasma and other serous secretions and is of value in diagnosis. In acute arthritis due to toxic disturbance, bacterial invasion, or acute trauma the synovial membrane thickens, becomes haemorrhagic, and pours out an excess of fluid which fills the joint space and causes pain and loss of function in the joint. This may progress to chronic thickening of the membrane and to destruction of cartilage with ankylosis following. Where subacute synovitis, local tenderness, pain and stiffness of the joint, and an excess of synovial fluid are present, synovectomy is indicated, and is a useful operation in polyarticular and non-articular arthritis. In nearly every case out of fifty treated by synovectomy, pain was relieved and weight-bearing re-established; 65 per cent. showed marked gain in health. The removal of both semilunar cartilages in a complete synovectomy improved the function and gave greater relief from pain. Synovectomy is said to have value in the chronic subacute stage of gonorrhoeal arthritis, but to be contraindicated in acute cases.

Therapeutics.

451. Treatment of Warts.

E. LANGER (*Med. Welt*, February 9th, 1929, p. 200) remarks on the many superstitions concerning the cure of warts and the truth underlying some of them. Warts may be only a disfigurement, but may come to be a serious disability in certain types of work and in certain areas. They are most frequently seen on the dorsum of hands, fingers, and feet, the face and the forehead. They are commonest in children and young people, but may occur in old age. Their cause is not known; their infective nature is widely held and has been proved experimentally and clinically, given a susceptible soil; against this others point to their appearance in uninjured skin and to the success of treatment by suggestion, from which a psychic origin is inferred. As regards treatment, arsenic may be given internally for sessile warts in young people; mercury is also useful. If successful these cure quickly and without scar formation; they are, however, uncertain, but are harmless and worth trying. Scars are especially to be avoided on the face; here the warts should be frozen with ethyl chloride and scraped off with a sharp spoon and the root touched with trichloracetic acid or with a styptic. Of chemical applications the most reliable is said to be trichloracetic acid, which leaves a fine, smooth scar. The same may be said of salicylic and lactic acids in collodion applied twice daily. Such treatment should not be left to the patient to carry out. Fuming nitric acid should be applied cautiously and never on the face because of the risk of scar or keloid formation. A 1 in 10 solution of salicylic acid in glacial acetic gives good results; previous softening of the warts with 10 to 20 per cent. salicylic acid plaster is recommended. As regards physical treatment, *x* rays and radium must be used cautiously and in exact dosage, or the resulting scars, especially in obstinate cases, may be more disfiguring than the warts. Langer finds electro-coagulation more satisfactory than electrolysis; even with numerous warts one or two sittings are sufficient. Bieberstein, working on the assumption that the infectious nature of warts is proved, gives intracutaneous injections of a vaccine prepared from warts, and has had good results. Similar injections of milk have been successful in flat warts. Lately suggestion has been tried, and in some hands gives satisfactory results. The author emphasizes the need of giving due attention to this minor but often disfiguring and even disabling ailment.

452. Opium Therapy in Infancy.

IN a short review G. BLECHMANN and P. DELTHIL (*Rev. de Méd.*, No. 8, 1928, p. 1061) show that contradictory opinions are held as to the advisability of administering opium to infants, and maintain that all trouble can be avoided by giving fractional doses of largely diluted preparations. With these precautions most derivatives of opium can be used, the average dose being 1 mg. of morphine for each year of age, though this must vary with the intensity of the symptoms. Infants seem to tolerate the alkaloidal forms of opium better than the complex ones, such as laudanum. The principal opiates used in infancy are discussed. The formula of laudanum has been changed, so the amounts formerly prescribed can be safely doubled and 2 or 3 minims per year of life be considered as a normal dose. The "elixir paregoric" contains 1 cg. of morphine in 20 grams, and is especially useful in the second and third months of infancy. Syrup of opium, which contains 1 cg. of morphine in 100 grams, is indicated in benign cases, but is too inactive for use in acute ones. Dover's powder has a sedative action, which is counterbalanced by the expectorant effect of the ipecacuanha; 10 cg., corresponding to 1 mg. of morphine, is the maximum dose for a child 3 years old. Codeine, only employed in infants in the form of the syrup, is considered the best cough sedative for children over the age of 3. The normal dose is 1 to 2 grams per year of age. Subcutaneous injections of opium extracts are not advised. In cases of emergency a 1 in 100 solution of morphine hydrochlorate may be given to older children, and a 1 in 1,000 to young ones. In this dilution 1½ or 2 mg. per year of age may be given fractionally in several doses. This drug or pantopon in a 1 in 100 dilution may be given orally in doses of 1 to 2 minims for each year of age. Syrup of morphine, which contains 1 cg. of morphine in 20 grams, may be used in doses of 1 to 2 grams per year of age, and is beneficially combined with other active syrups, such as that of chloral. Papaverine is of great value in oral doses of 1 or 1½ cg., or in subcutaneous injections of 1/3 to 1/2 cg. The authors consider that opium is of incomparable benefit in many infantile conditions; among these are intense thoracic pain, visceral colic, certain meningites, acute laryngitis, post-operative pain, asthmatic crises, and whooping-cough. It is also very useful in numerous digestive disturbances.

453. **Oxygen Therapy.**

P. ROTH (*Anesth. and Analges.*, January–February, 1929, p. 47) states that the amount of oxygen required by the average male or female adult at various ages when at rest or under the ordinary conditions of one confined to bed is approximately from 15 to 18 c.cm. per breath; this small allowance is one of the fundamental requisites of life. Failure in the constant and adequate supply of oxygen to the tissues is always serious. Acute asphyxia, as in drowning or electrical shock, is so rapidly fatal that prompt measures of resuscitation are imperative, even seconds in instituting these being of importance. When the process of oxidation in the tissues is interfered with, serious disturbances rapidly manifest themselves and soon become destructive to the living cell. The dangers of anoxaemia in all conditions resulting from or accompanied by an insufficient supply of oxygen are always grave. Haldane insists that the longer the period of oxygen deficiency lasts the greater is the progressive damage to the central nervous system, heart, and other organs, and the slower and more difficult does recovery become. The symptomatology of anoxaemia is discussed, and Roth asserts that general or local, acute or chronic anoxaemia in any degree of intensity is primarily the indication for oxygen therapy, which, like artificial respiration, is for the prevention and relief of asphyxia and anoxaemia. Early measures for the prevention rather than for the relief of this condition are strongly urged. Three methods of oxygen administration are described—namely, emergency methods, tents and hoods, and oxygen therapy chambers. Roth emphasizes the following points. Safety in anaesthesia depends upon the prevention of anoxaemia or asphyxia by the proper and timely use of oxygen and carbon dioxide inhalation. Oxygen therapy requires an experienced operator. Fire risks and the accidental cutting off of the supply of oxygen must be guarded against during the use of any apparatus and also in basal metabolism tests, especially with apparatus in which carbon dioxide absorbers are used.

454. **The Administration of Emetine.**

F. G. CAWSTON (*Journ. Trop. Med. and Hygiene*, January 15th, p. 22) considers that the prolonged administration of relatively small doses of emetine is more to be feared than that of a few heroic doses, and that the immediate toxic effects of the drug are less dangerous than those due to its cumulative action. Vomiting may occur after a large single dose, and usually shows that the largest single dose compatible with safety has been employed, as the acquired tolerance for emetine is so small that it does not exist for more than one or two days. The use of larger doses on alternate days enables the system to recover from the toxic effects of one dose before the next is given, and avoids further doses before the earliest signs of cumulative action are recognized. Among the serious indications of poisoning are increased pulse rate with listlessness and fretfulness, and cardiac depression. Towards the end of a course of relatively large doses albuminuria sometimes appears, and must not be mistaken for that due to disease of the bladder wall. Paralysis may occur, the earliest sign of which is the increased pulse rate, and further use of the drug results in looseness of the bowels, weakness of the legs, or indefinite paralysis of some nerve endings. These symptoms occur whether the emetine be given orally, intramuscularly, or intravenously. Cardiac stimulants should be used at the earliest possible moment after signs of the cumulative action of the drug become evident. The addition of 1 per cent. carbolic lotion to the emetine solution avoids local tenderness. Cawston has found that the curative dose for schistosomiasis is double that for amoebic dysentery, and that in the latter disease emetine should be given orally and at the same time intramuscularly. It is best to keep the patient at rest, and as soon as undesirable signs of emetine poisoning occur he should at once be put to bed.

455. **Blood Transfusion.**

P. ÉMILE-WEIL (*Bull. Soc. de Thér.*, February 13th, 1929, p. 37) maintains that to let a patient die from haemorrhage without employing transfusion is a grave blunder for which a legal penalty should be enforced. He considers, however, that a dose of 500 c.cm. is always sufficient, however great and violent the loss of blood. In nine out of ten cases a transfusion of this amount is sufficient to produce a permanent cure; if not, a second transfusion should be given six, twelve, or twenty-four hours later. Out of several hundred transfusions for gastric ulcer, haematemesis in splenomegaly, and extrauterine haemorrhage, the author has only had to employ multiple transfusions six times. In giving a transfusion of 500 c.cm., 1.50 grams of sodium citrate is sufficient, and, far from being harmful, it adds its own haemostatic properties to those of the blood.

Neurology and Psychology.

456. **Glioma of the Medulla.**

O. C. PERKINS (*Journ. Nerv. and Ment. Dis.*, January, 1929, p. 26) reports a case of glioma of the medulla belonging to that rare group which present local but no general symptoms. These symptoms are generally produced by a lesion of the posterior inferior cerebellar artery with involvement of the hypoglossal nerve and the pyramid. In the present case sections at various levels showed a glioma infiltrating the left side of the medulla from the pyramidal decussation to the mid-olive region. In infiltrating tumours of this type destruction of the brain tissue generally results from prolonged pressure, and secondary degenerations are quite common. In the case under discussion the following ipsilateral symptoms were noted: hemi-asynergia and hemi-ataxia, laryngoplegia and palatoplegia, paralysis of the sterno-cleido-mastoid and trapezius muscles, hemifacial anaesthesia, nystagmus, facial paresis, and paralysis of the tongue. Contralateral symptoms were hemiplegia and loss of pain-temperature sensibility except over the face; other symptoms were vertigo and irregularity of the heart and respiratory rate. Correlation of these symptoms with the pathological findings is fairly clear. The hemi-asynergia and hemi-ataxia were due to involvement of the dorsal and ventral spinocerebellar tracts, and the laryngoplegia and palatoplegia to infiltration of the nucleus ambiguus. Paralysis of the two muscles mentioned was caused by invasion of the entire region where the spinal accessory nerve emerges; the hemi-anaesthesia was probably due to an intrusion into the descending pyramidal tract; and the nystagmus to involvement of the descending vestibular nucleus and tract. The contralateral hemiplegia resulted from involvement of many of the pyramidal fibres of the decussation; and the loss of pain-temperature sensibility from involvement of the lateral spinothalamic tract. The facial paresis cannot be accounted for, as there was no involvement of either the nucleus or efferent peripheral neurons. The irregularity of the heart and respiratory rate was due to direct invasion of the peripheral neurons of the vagus. Intense vertigo is often seen in subtentorial tumours, as they involve the cerebellar system.

457. **Psychological Results of Birth Trauma.**

THOUGH there has been much research into the effects of pathological pregnancy and labour, such investigations have been chiefly concerned with the physical condition of the child. P. L. SCHROEDER (*Journ. Amer. Med. Assoc.*, January 12th, 1929, p. 100) gives a brief review of the references to intelligence in the early literature, and details a study of 145 children having infantile cerebral palsy, and of 79 others showing signs of cerebral injury at birth. In the former group only 7 (4.8 per cent.) were diagnosed as premature, and 22.8 per cent. showed one or more of the following signs: inability to suck, cyanosis, asphyxia, deformed head (other than caput succedaneum), convulsions, and paralysis before the second month. In the second group the percentage of premature births is 7.6—that is, almost twice as great as in the infantile cerebral palsy group. Requests for examination in the behaviour clinic of the Institute for Juvenile Research are generally made because of retardation, delinquency, and "nervousness." Schroeder's conclusions from this study are that difficult labour tends to determine behaviour problems, which, however, are chiefly the result of mental retardation. Distractibility and hyperactivity are characteristic personality traits in the birth traumas, but no behaviour difficulty is specific. Children with cerebral birth injuries who do not develop palsies show the behaviour characteristics and mental retardation common to those with cerebral birth palsies, and differences of behaviour in this group are largely explained by the absence of orthopaedic handicap. Children with cerebral injury at birth who show distractibility and hyperactivity, although free from birth palsies, should therefore be included in the classification of the results of birth trauma.

458. **Syphilis of the Nervous System in Buenos Aires.**

M. ALURRALDE and M. J. SEPPICH (*Bull. Off. Internat. d'Hyg. Publ.*, December, 1928, p. 1951) state that the clinical manifestations of syphilis of the nervous system are nowadays more frequent and appear earlier, especially in patients who have been treated exclusively with salvarsan, or in those who after an inadequate mercurial treatment had subsequently been treated exclusively or systematically with arsenobenzol. During the last twelve years the proportion of cases of nerve syphilis at Buenos Aires has risen from 14 to 21.65 per cent. The most frequent clinical form is tabes, the incidence of which has risen from 2.64 per cent. in 1915 to 5.10 per cent. in 1925. The syndromes next more

frequently encountered are those due to local arteritis—namely, right hemiplegia with aphasia 4 per cent., left hemiplegia 3.65 per cent., and general paralysis 2.3 per cent. No appreciable rise has been noted in the neuritic forms. Of recent years there has been a decline in frequency of latent or attenuated forms of nerve syphilis—namely, from 7.10 per cent. in 1918 to 2.9 per cent. in 1925, a fact which may be explained by the systematic use of lumbar puncture, whereby forms corresponding to tabes and general paralysis can be identified in their preclinical stage.

Obstetrics and Gynaecology.

459. The Advantages of Vaginal Hysterectomy.

V. B. GREEN-ARMYTAGE (*Indian Med. Gaz.*, November, 1928, p. 613) upholds the superiority of vaginal over abdominal hysterectomy, especially in the East, where "cutting the stomach" is very unpopular. A review of 150 consecutive cases of vaginal hysterectomies, with a mortality of 2 per cent., is given. Many of the operations were for fibromata, but only if the tumours were no larger than a cricket ball. In larger growths abdominal hysterectomy is held to be indicated. Before undertaking vaginal hysterectomy for fibroids it is important to discover whether there is pain in the tumour, or whether attacks suggestive of localized pelvic peritonitis have occurred. If on careful examination the tumour is found to be fixed, the rectum or intestines are probably densely adherent and the vaginal operation is precluded. The next most common indication for vaginal hysterectomy is chronic metritis. There are three types of this condition: the large subinvolution type, caused by a low-grade degree of sepsis, either from a lacerated cervix or an incompletely emptied or retroverted uterus after labour or abortion; the hypertrophic type, commonly seen in prostitutes or as the sequel of contraceptive measures; and the arterio-sclerotic type, in which the patients bleed furiously and in all of which hypertension, and in many generalized arterio-sclerosis, is present. Haemorrhage, with or without backache, is the indication for operating, but before doing so extensive tubo-ovarian inflammation must be excluded by digital examination. A large proportion of the cases was operated on for so-called precancerous cervix—that is, a cervix lacerated, everted, and eroded, with deep infiltration of the mucosa and endocervicitis. These patients suffer from leucorrhoea, menorrhagia, and backache, the latter being due to lymphangitis and swelling of the glands in the hollow of the sacrum. Only seven cases were operated on for cancer of the cervix. The author advocates vaginal hysterectomy for cervical cancer in only exceptional conditions, and considers that an operable case of this condition is best treated by radium, followed, if desired, by abdominal hysterectomy. In all the cases the static results were excellent, but convalescence was tardy in three cases from oozing or sloughing of the posterior vaginal wall. The advantages of vaginal hysterectomy are: rapidity of the operation, absence of shock, lessened risk of infection as the operation is extra-peritoneal, and no painful scar or danger of post-operative hernia results. The operation is said to be ideal in chronic metritis, small fibromata or very early cancer, in precancerous cervix, and in certain conditions of prolapse in the aged.

460. Diathermy in Cancer of the Cervix.

J. MERLIN (*La Gynécol.*, January, 1929, p. 5) maintains that in early diagnosed cervical cancer the sole really curative measure is surgical intervention, and that only in inoperable cases and cases requiring pre-operative treatment are physical agents advisable. Such cases are divided into two groups. In the one the mobility of the uterus is doubtful, and swelling of the parametria is present. In these cases a pre-operative radium treatment may be employed, but this should be reserved for ulcero-sclerous cases with slow evolution and slight infection. In the other group the uterus is almost mobile, but there exists a large infected granulation. In these patients diathermo-coagulation is indicated. While pre-operative radium therapy is efficacious, Merlin points out certain disadvantages to that method. It is slow, much time being necessary for the treatment itself and for the elimination of the sloughing granulations; the vaginal mucosa is always injured by the irradiation and must be reconstituted; and there is always a resorption by the lymphatics and blood vessels of waste cellular products and toxins injurious to the liver and kidneys. The risks of curetting and the dangers and needlessness for diagnosis of biopsy are alluded to. Diathermy, a method too little employed, permits the infected, haemorrhagic, granulating cervix to be cleaned rapidly, without haemorrhage or any risk of infection, and with an almost perfect microbic sterilization. This can be effected in a minimum of time, with practically no pain, and with a facility of application. The method consists in supplying calories to the whole uterus or one of its parts by means of oscillating currents of very high frequency. Merlin uses a Walter high-frequency apparatus, and describes his technique. Coagulation is effected and the treated tissues are eliminated in fifteen days. Besides being of great benefit as a pre-operative measure, diathermy is the only method to employ in recurrences. For recurrent nodules on the cervix and uterine walls radium and x rays are strongly contraindicated; in these cases the bipolar method should be employed. The effect obtained is only superficial, and this is important, as tissues already modified and difficult of cicatrization should not uselessly be injured.

461. Rupture of a Pyosalpinx causing Peritonitis.

L. SABADINI (*Rev. de Chir.*, No. 9, p. 629) draws attention to the rarity of this occurrence, and reports two instances which have recently come to his notice. The two conditions which can give rise to peritonitis are: (1) rupture of the Fallopian tube, usually caused by trauma, and affecting a tube which is the seat of a chronic salpingitis; and (2) perforation, which occurs in an acutely inflamed tube similar to a perforated appendix. Rupture may be the result of one of many different forms of trauma, such as the effort of straining in defaecation or labour, shock as in gynaecological examination or coitus, or traction on the neighbouring viscera during uterine contraction in childbirth. In the case of rupture, symptoms may not appear for several days, but in perforation they are manifested immediately, the first sign usually being an intense and violent pain either in the right or left iliac fossa, or spreading over the whole abdomen below the umbilicus. The pain is accompanied by collapse, sweating, a shallow and rapid pulse, and a quick rise in temperature, with nausea followed by vomiting. The abdomen shows the characteristic signs of peritoneal infection, and immediate surgical intervention is necessary. This should take the form of a sub-umbilical laparotomy; the peritoneal cavity must be freed from pus, cleansed by means of an ether swab, and adequately drained. In both Sabadini's cases this conservative operation was successful, and it is pointed out that if it is ever found to be insufficient the more radical operation of hysterectomy or salpingectomy may still be performed.

462. Methods of Inducing Labour.

R. A. REIS (*Amer. Journ. Obstet. and Gynecol.*, March, 1929, p. 392) reports an investigation of 500 consecutive inductions of labour in 430 patients, during a period extending from January 1st, 1925, to April 1st, 1928; the pregnancy in all cases was calculated as having lasted for more than thirty-eight weeks. In 388 patients the induction was successful, but in 26 patients two inductions were required, and in 16 from three to five inductions. Six different methods were tested, the most effective of the medicinal remedies being found to be castor oil, quinine, and pituitrin; at or near term the efficacy of these medicinal methods was materially enhanced by stripping of the membranes. Reis remarks that induction methods at or near term are as efficient in primiparae as in multiparae, and that the character of the delivery is not affected. Morbidity without stripping the membranes was slightly greater than the average morbidity in the obstetrical department as a whole; the addition of the stripping procedure resulted in a further increase in morbidity, but, even so, the figures were approximately only one-third of those recorded when bag induction was employed. No evidence was obtained that these procedures were dangerous to the foetus.

463. Vulval Expulsion of the Retroverted Gravid Uterus.

M. HENKEL (*Zentralbl. f. Gynäk.*, February 2nd, 1929, p. 287) states that incarceration of the retroverted gravid uterus, if not treated by reposition, proves fatal, in the majority of cases, from sepsis of the urinary or genital tract. In a case which he reports there was an unusual but ultimately favourable termination. The patient, a 9-para, aged 35, showed during the fourth month the usual clinical signs of incarceration of the retroverted gravid uterus—dysuria, pain, ammoniacal cystitis, and the whole of the small pelvis filled by the retroflexed womb; in addition, she had prolapse of the posterior vaginal wall, which contained a small area of incipient necrosis. The bladder having been emptied, operative correction of the malposition was postponed for twenty-four hours; the next day, however, the whole of the uterus was found extruded from the vulva, whither it had been expelled suddenly through the posterior vaginal wall. Recovery followed hysterectomy. A parallel case with a similar fate was recorded by Rosenberger in 1909.

Pathology.

464. Effects of Ultra-violet Rays on the Blood.

A. S. SMALL (*New England Journ. Med.*, March 7th, 1929, p. 484) records the results of investigations in fourteen cases of active rickets with associated anaemia undertaken with a view to observing the effects of ultra-violet rays upon the capillary blood. The observations were made during the winter and spring months over a control period of from ten to twenty days, after which the blood was examined about once in seven to fourteen days for the next four to twelve weeks, the children being kept as nearly as possible on the same diet as they had been receiving prior to admission. The blood examination included erythrocyte, leucocyte, differential, platelet, and reticulocyte counts with haemoglobin determinations, a deep puncture being made in the same finger, toe, or heel each time, and a free flow without pressure promoted, the specimens so obtained being as nearly as possible at the same time of the day of each week in order to obviate any variations in the white cells. After puncturing, the first drop of blood was wiped away, the second being taken for a white count, the third for a red count, and the fourth, fifth, and sixth for haemoglobin determinations, and so on. The red cells were found to be in number and form consistent with a mild degree of anaemia without any marked increase in number; the white cells were within the normal limits, but in several cases a slight increase in the number of lymphocytes was observed. Reticulated red cells showed a fairly constant figure. Exposure of infants to various types of ultra-violet transmitting glasses as well as the Alpine lamp failed to produce any outstanding changes in the capillary blood beyond, in some cases, an increase in lymphocytes, though with the exception of those treated by vitaglass and ordinary window there was evidence of healing or healed rickets. From these investigations it would appear that the treatment has practically no beneficial effect on the associated anaemia.

465. Action of Adrenaline and Nicotine on the Pulmonary Circulation.

W. E. DIXON and J. C. HOYLE (*Journ. of Physiol.*, February 28th, 1929, p. 77) remark that, as concerns its vascular effects, adrenaline produces the same type of action as stimulation of vasomotor nerves. Wiggers has pointed out that its cardiac action masks any trifling direct effect it may have on the pulmonary vessels. The present authors also have shown that its action is seen equally well after the cardiac nerves have been divided, and after the autonomic ganglia have been paralysed. Nicotine affects the autonomic ganglion cells, acting on the motor and not on the sensory cells. This drug has another, not so well known, action, and a good deal of evidence exists to show that it acts not only on ganglion cells but also on more peripheral structures. Since its effect on the heart and systemic blood pressure are practically identical with that of adrenaline, it affords a useful substance with which to compare the action of the latter on the pulmonary circulation. A series of experiments on cats and dogs were performed in which doses of nicotine and adrenaline, which produced similar effects on the blood pressure and heart, were injected intravenously at a standard rate. The authors found that adrenaline, injected intravenously, caused a rise in pulmonary arterial pressure, an increase in the vascular volume of the lung, greater outflow from the pulmonary veins, and a rise in the left auricular pressure. Direct action on the heart and coronary dilatation are considered to be the important factors in producing these effects. Injections of nicotine had relatively little effect on the pulmonary pressure while diminishing the vascular volume of the lung, and causing a diminished outflow from the pulmonary veins and a fall in the left auricular pressure. Constriction of the pulmonary vessels, and, with very small doses, the coronary, is considered to be the deciding factor responsible for the differences from the action of adrenaline. Both drugs in large doses cause cardiac embarrassment from systemic vaso-constriction, and this results in secondary changes in the pulmonary circulation.

466. Experimental Increase in the Virulence of the B.C.G. Strain.

S. W. KORSCHUN, P. P. DWIJKOW, and A. J. GOROCHOWNIKOWA (*Centralbl. f. Bakt.*, March 8th, 1929, p. 297) bring evidence to suggest that it is possible under experimental conditions to raise the virulence of the B.C.G. strain of tubercle bacillus. Their general procedure was to inoculate the organism into guinea-pigs, recover the strain from the lesions, and inoculate this into fresh animals. After three passages made by subcutaneous inoculation no evidence was obtained of any appreciable alteration in virulence. But after three further passages made by intraperitoneal, and three further passages made by intratesticular inoculation, there did appear to be a definite increase in the virulence of this organism. Thus the injection intraperitoneally of the ninth passage strain, recovered from the testicle, killed a guinea-pig in fifty-one days; at necropsy there was great emaciation and the presence of numerous masses in between the viscera; the spleen was three times its usual size and was studded with grey nodules; the liver was friable and contained a number of miliary grey nodules and a few larger nodules; in both testicles there were caseous masses about the size of cherry stones. The authors consider that the production of a generalized tuberculous infection must be regarded as evidence that the virulence of the strain had been increased by passage.

467. A Pathogenic Streptothrix.

LE BARON and R. PATAY (*C. R. Soc. de Biologie*, March 15th, 1929, p. 695) describe the case of a man, aged 37, who during the course of a year developed abscesses in numerous parts of the body, affecting chiefly the subcutaneous tissue and muscles; the abscesses were often large, sometimes discharged as much as 500 c.cm. of pus, and generally became fistulous. Microscopical examination of the pus showed the presence of numerous groups of short branching filaments with a terminal or subterminal spore. The filaments were Gram-positive and non-acid fast. The organism was cultivated on alkaline potato, on which it grew poorly. No growth occurred on the ordinary media or on ascitic agar; but on blood agar or serum agar growth proceeded rapidly, with the formation of moist, grey, convex colonies. In serum broth there was an abundant growth with a flocculent deposit. Gelatin was not liquefied. Acid was produced in glucose, maltose, mannite, levulose, lactose, and sucrose, but not in glycerin. The optimum temperature for growth was 37° C., but growth occurred slowly at room temperature. The organism was apparently a facultative anaerobe. Cultures remained viable for two months. In order to destroy the organism in cultures it was necessary to heat it for one hour at 70° C. Inoculated subcutaneously or intramuscularly into guinea-pigs, the organism gave rise to an abscess which opened spontaneously. Inoculated intraperitoneally into guinea-pigs, it proved fatal in twenty-four hours, and at necropsy multiple small abscesses were found in the omentum together with a slight exudate. Intravenous inoculation into rabbits was without effect, but intramuscular inoculation gave rise to a large abscess which proved fatal before spontaneous opening occurred. Histologically the experimental lesions consisted of a filamentous network containing a few spheres at the periphery, and surrounded by polymorphs; outside there was a layer of granulation tissue.

468. The Spinal Fluid in Chronic Alcoholism.

L. STERN and E. S. LOKSCHINA (*C. R. Soc. de Biologie*, February 16th, 1929, p. 465), as the result of experiments, report the following conclusions. (1) In a rabbit which was in a state of chronic alcoholic intoxication increase of the body temperature to 41.5° C. caused the passage into the cerebro-spinal fluid of crystalloids such as sodium iodide, and colloids such as Congo red and trypan blue. It is noteworthy that even higher temperatures do not in normal animals cause a passage of crystalloids from the blood into the cerebro-spinal fluid, while alcoholic intoxication alone produces an increased resistance to crystalloids. (2) Fall of the body temperature to 34.4° C. produced in the alcoholic rabbits a passage of crystalloids and colloids into the cerebro-spinal fluid contrary to what is seen in normal animals. (3) In the alcoholic rabbit injection of diphtheria toxin produced a passage of crystalloids and colloids from the blood into the cerebro-spinal fluid during the pyrexial period on the day following the injection of toxin, whereas in the normal animal this does not take place until just before death.

469. Complement-fixation Reaction with Rabies and Herpes Viruses.

F. TANG and M. R. CASTANEDA (*Journ. Immunol.*, February, 1929, p. 151) report experiments on the complement-fixation reaction in rabbits immunized against rabies or herpes. The animals received a long series of inoculations, which were apparently sufficient to render them refractory to the intracerebral inoculation of living virus. In the performance of the complement-fixation reaction two antigens were used: (1) a "cooked" antigen, prepared by heating a 10 per cent. saline suspension of the brain to 100° C. for thirty minutes; (2) a plain unheated glycerin extract antigen. Both antigens were kept in the refrigerator, and the supernatant fluid only was used. The results were disappointing. The cooked antigen was less anti-complementary than the unheated antigen, but with neither was any evidence obtained of specific fixation in the serum of rabbits immunized against rabies or herpes.

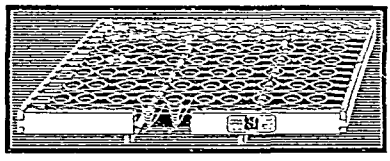
OF DEFINITE VALUE IN THE PROMOTION OF SLEEP

AS SUPPLIED TO H.M. THE KING

There is one physic which never fails of its purpose—sleep. A Staples Mattress will not ensure it, but is of definite value in promoting it. The reason is simple—the lithe steel springs afford *equal support to all parts of the body*—thus the muscles are fully relaxed and the nerves automatically follow suit—sleep is naturally *induced* with the Spine Straight and the internal and digestive organs undistorted.

BY APPOINTMENT
Wire Mattress and
Bedstead Manufacturers
to H.M. THE KING

Sold by ALL Furnishers 3 ft. 99/-, 4 ft. 6 ins. 118/6



STAPLES MATTRESS

"The finest mattress made"
Regd.

A visit to our works showroom at Staples Corner, Crick'ewood, is well worth while. The "Commonsense Health" Mattress Booklet and new 1929 catalogue of Staples Bedstead Designs, are sent post free on application to Dept. 4.

RHEUMATOID-ARTHRITIS
LUMBAGO SCIATICA
NEURITIS

ALL THESE CONDITIONS YIELD RAPIDLY TO A COURSE OF

ELIXIR FORMASAL CO
AND
TAB. ARTHRITONE

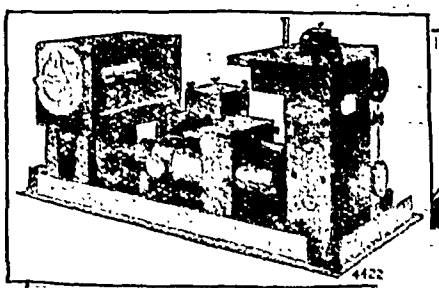
The combined treatment is giving excellent results in cases of Rheumatoid Arthritis which have stubbornly resisted all other forms of medication.
The results that are being obtained by the profession are very striking, and no practitioner can afford to be without a supply.

Please note, our preparations are not advertised to the public.

Price

ELIXIR FORMASAL Co. 4/3 lb, WINCHESTER 4/- lb.
TAB. ARTHRITONE 4/6 Per 100 — 32/6 Per 1,000.

HOUGH - HOSEASON & Co. LTD MANCHESTER
PHARMACEUTICAL SPECIALISTS TO THE MEDICAL PROFESSION.



Electrocardiograph without case

CAMBRIDGE PORTABLE CARDIOGRAPH

A novel form of film camera enables four films (6¾ × 3¼ inches) to be exposed in three sections in the normal way, without using a dark room. Non-immersion electrodes are used. The source of light is a 12-volt lamp. The outfit, including the battery, is contained in compact carrying cases.

Electrocardiograph in case

This apparatus is similar in principle to the standard Einthoven electrocardiograph (and produces exactly *similar records*), but is arranged in a portable form, so that it may be easily taken to a patient's house.

CAMBRIDGE INSTRUMENT CO. LTD.

WORKS: LONDON & CAMBRIDGE

Head Office & Showroom 45, GROSVENOR PLACE, LONDON, S.W.1

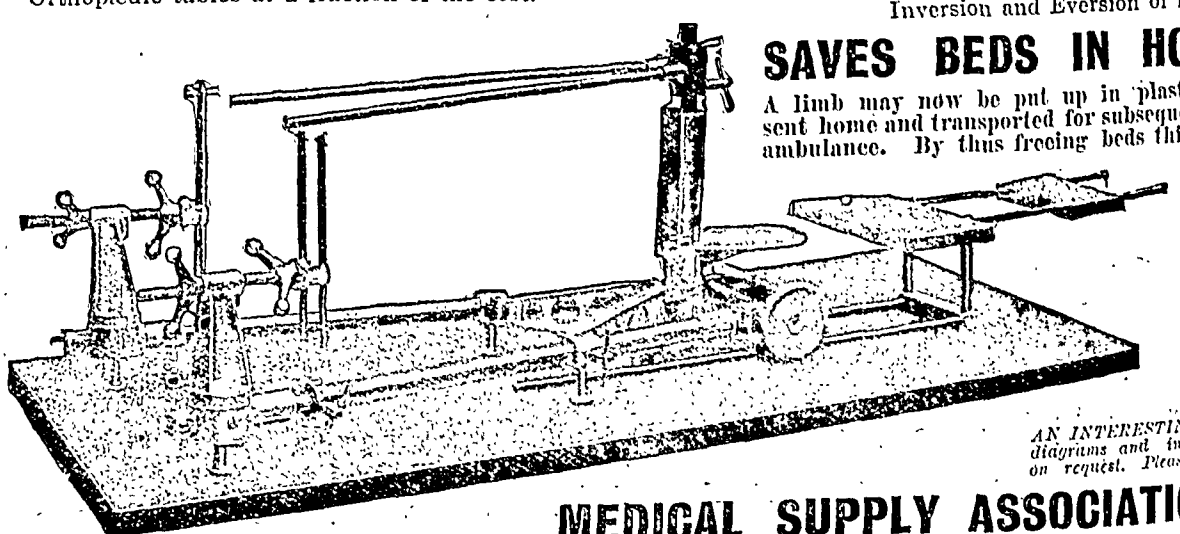
An IMPROVED and MODIFIED

Portable Traction Apparatus

An exceedingly efficient and convenient apparatus for putting up in plaster the lower limbs or trunk; also when applying bone plates or Parham and Martin's Bands to long bones of the lower extremity. Provides the more essential movements of expensive and bulky Orthopædic tables at a fraction of the cost.

Quickly adaptable for the following positions:

Extension of whole lower limbs.
Movements about hip-joint:
Abduction to any degree—
Hyperextension—Flexion—
Internal and External Rotation.
Flexion of knee-joint.
Inversion and Eversion of foot.



SAVES BEDS IN HOSPITALS

A limb may now be put up in plaster, the patient sent home and transported for subsequent treatment by ambulance. By thus freeing beds this new apparatus saves its cost many times over.

Folds compactly for storage or transit in plywood case 32 in. × 14 in. × 7 in.

AN INTERESTING LEAFLET giving diagrams and instructions, post free on request. Please ask for a copy.

MEDICAL SUPPLY ASSOCIATION, Ltd.,

SURGICAL SERVICE
SALTAIR

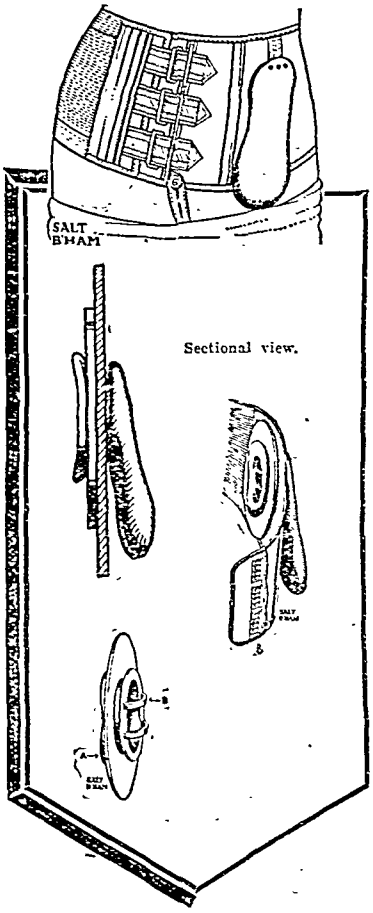
SALTAIR SURGICAL SERVICE

Guarantee

"We guarantee to alter, exchange, or accept the return of any appliance without cost, ordered by the Medical Profession, if not found suitable within fourteen days from date of supply."

Salt and Son Ltd.

Combines Personal Comfort and Hygiene



SALTS'
PATENT
COLOSTOMY BELT

Entirely frees those who have to wear this appliance from those embarrassments so often attendant in other makes of this belt.

The CUP of moulded rubber is held in position by the belt and can be sterilized by boiling.
The RIM outside the belt has curved rubber bars which keep the bag-mouth open and allow free entry of fæces.
The BAG is instantly detachable, and has a large mouth which enables it to be emptied, turned inside out, and thoroughly flushed. The rubber is such that sterilizing by boiling does not affect it.
There are no crevices, ordinary rubber, or vulcanite fittings to retain smell.

NOTE—
SALTS' Patent COLOSTOMY BELT
has been primarily designed to preserve personal comfort and hygiene.

SALT AND SON LTD.
7, CHERRY ST., BIRMINGHAM.

ESTABLISHED 1793.

FOR DEAFNESS

Doctors prefer "ARDENTE" because

1. It is individually fitted to suit the case for young, middle-aged, or old.
2. It is simple and true-to-tone, and leaves the hands free.
3. It removes strain, thus relieving head noises.
4. It conveys sounds from all ranges and angles.
5. It is entirely different, uncopyable, and carries a guarantee and service system.
6. It is suitable for "hard of hearing" or acutely deaf.
7. It is helpful for conversation, music, wireless, home, office, public work, and sports.

"ARDENTE" STETHOSCOPE.
Mr. R. H. Dent makes a Stethoscope specially for members of the medical profession suffering from deafness. Many are in use, and excellent results are reported on the latest, which delighted Medical Men at the recent B.M.A. Meeting.

MEDICAL REPORTS.
Commended by all leading medical journals.—Mr. Dent will be happy to send full particulars and reprints on request.

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS,
NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary Boarders, persons suffering from incipient nervous and mental disorders, as well as certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients and voluntary boarders can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical baths, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, *and a* Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The Seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Voluntary Boarders or Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc

For terms and further particulars apply to the Medical Superintendent (Telephone: No 56 Northampton), who can be seen in London by appointment

MANCHESTER TUTORIAL COLLEGE,
327, Oxford Road, Manchester.

THE PRIVATE GENERAL HOSPITAL, COLOMBO.

(Estd. 1928.)

(For the information of members of the profession in Ceylon and South India.)

In-patient Entrance: WARD PLACE.

Entrance to Outdoor Clinic of Specialised Departments: NORRIS CANAL ROAD.

Objects.—(a) In-patient Department.

(1) To give Medical, Surgical, Maternity, and Specialized medical relief to all classes except the indigent.

(2) To give indoor treatment to patients who are permitted to consult one or several qualified medical practitioners according to their own wishes.

(3) Special in-patient facilities to those whose incomes do not exceed Rs.500 per mensem.

(b) The Outdoor Clinic of Specialised Departments.

Open only to that section of the public whose income does not exceed Rs.200 per mensem.

The Outdoor Clinic is divided into the following departments:

(1) Clinic for Metabolic Disorders;
(2) Clinic for Nervous and Respiratory Diseases;
(3) Clinic for Heart Diseases and Electro-therapeutics;
(4) Clinic for Skin and Venereal Diseases;
(5) Clinic for Diseases of Women;
(6) Clinic for Diseases of Children;
(7) Surgical Clinic;
(8) Clinic for Eye, Ear, Throat, and Nose;
(9) Ante-natal and Obstetrical Clinic;
(10) Clinic for Tropical Diseases.

Honorary Consultants to the Clinic in the various departments are members of the staffs of the leading Institutions in Colombo, and other medical men who are specially qualified to be consulted in their respective specialties.

A small commuted fee is payable to cover consultations. Laboratory examinations, and medicines, the latter given only to cases which come without the general medical practitioner's card.

As soon as satisfactory diagnosis is made, the cases are referred for further treatment to the general practitioners of the neighbourhood in which the patient resides, and will not be further advised upon without the practitioner's card of request.

The special objects of this Outdoor Clinic are:

(*a*) To promote co-operation between the general practitioners and consultants, and help the busy general practitioner in the diagnosis of the more intricate ailments among his poorer patients who are not entitled to poor relief.

(*b*) To encourage the more highly qualified members of the medical profession to confine themselves to their specialties, and thus help the general practitioner, his poorer class of patients, and the advancement of scientific medicine in this country.

Resident medical attention is also provided for within the premises for this class of patients.

The Receiving Medical Officer attends to all the Out-patients before allotment to the respective clinics.

The Nursing Staff of the Hospital is under European management.

For particulars, please apply to the Resident Medical Superintendent, or to the Secretary, Mr. D. W. WANAGURU, Private General Hospital, Colombo.

University of Birmingham.

(Faculty of Medicine.)

Rhondda Urban District Council.

ASSISTANT MEDICAL OFFICER.

The above Council invite applications from male registered medical practitioners to act as whole-time Assistant Medical Officer of Health and Assistant School Medical Officer, under the direction, supervision, and control of the Council's Medical Officer of Health, at a salary of £600 per annum, together with travelling expenses necessarily incurred in the performance of the duties.

Candidates must have had not less than three years' professional experience subsequent to registration, and the possession of a Diploma in Public Health is desirable.

The duties will pertain to both public health and school medical services, but experience in the work of school clinics, including the examination and certification of defective children, orthopædic work, and the prescription of glasses for errors of refraction, will be considered to be of special importance.

The appointment will be subject to two calendar months' notice on either side, and to the approval of the Board of Education. The officer appointed will be required to reside within the Rhondda Urban District and will not be allowed to engage in private practice.

Canvassing by or on behalf of candidates will be considered to be a disqualification.

*Applications are to be made on forms obtain*able from the Medical Officer of Health, Tydfil House, Llewelyn Street, Pentre, Rhondda, by whom they must be received, endorsed "Assistant Medical Officer," and accompanied by copies of three *recent testimonials, not later* than the first post on Saturday, May 18th.

The Council Offices, D. J. JONES,
Pentre, Rhondda. Clerk of the Council.

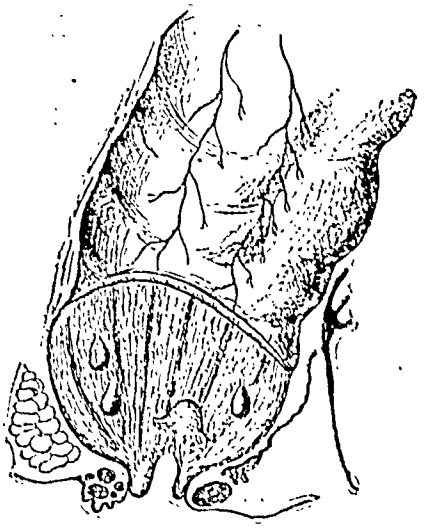
Midwifery 3 to 10 gns.; about 30 cases yearly. Surgery premises can be rented on lease, and contain consulting room, waiting room, 3 bedrooms. Electric light. Garden. Purchaser can choose his own place of residence. Premium 1½ years' purchase, with 1 or 2 years' partnership introduction as required.
15. STAFFS.—LARGE TOWN.—Owing to ill health of present Incumbent, an old-established good-class non-panel non-dispensing PRACTICE is for immediate disposal. Income last year over £1,200. Fees 5/- to 10/-. Commodious house, in best residential road. Price for freehold £1,600, part on mortgage. Prem. £1,500, payable easy instalments.
16. SOUTH-WEST OF ENGLAND [illegible] rge Thriving Hospital Town.—[illegible] nths share in an old-established [illegible] eneral and surgical Practice can [illegible] n possessing the F.R.C.S. degree. [illegible] average over £5,000 p.a. Good [illegible] at present held on lease with [illegible] ars' purchase.
17. SOUTH-WESTERN COUNTY.—LARGE SEAPORT TOWN.—Old-established mixed-class PRACTICE averaging over £3,000 p.a., including panel of 2,100. Visits 3/6 to 10/6; midwifery (discouraged of late) 3 gns. upwards, about 30 cases yearly. Expenses light (Assistant not necessary). House contains professional accommodation, 3 sitting, 6 bedrooms, bathroom, etc. Large garden, garage. Vendor's freehold price £2,800, of which £1,200 can remain on mortgage, or might be rented at £96 p.a. Premium 1½ years' purchase, £3,000 down and balance by arrangement.
18. BORDERS OF NORFOLK AND SUFFOLK. — Very old-estab. good middle-class PRACTICE, averaging over £1,000 p.a., including panel of 530. Visits from 3/6. Easily worked. Very attractive house, modernized, and containing 3 reception, 6 bedrooms, bathroom (h. and c.), separate professional accommodation. Price for freehold £2,000. Premium £1,500.
19. BORDERS OF CORNWALL AND [illegible] share is offered in a very sound [illegible] delightful district, near coast. Gros[illegible] including panel of over 1,200, and [illegible] venient house, with 3 reception, 4 bedrooms, and usual offices. Garden. Price £750, part on mortgage. Premium 2 years' purchase.
20. NORTH DEVON.—Within easy reach of favourite town.—PARTNERSHIP.—A one-third share (to commence) in a well-established and increasing Practice, producing about £3,000 p.a., including panel of over 2,000. Fees 3/6 to 10/6. Choice of houses. Excellent sport, good schools. Premium 2 years' purchase, half down and balance by instalments.
21. LONDON, S.W.—PARTNERSHIP.—A one-fourth or one-third share in an old-established good middle and better working-class Practice, producing £2,500 p.a. Preliminary assistantship offered. Scotch Graduate, 25 to 35, preferred.
22. LONDON, S.W.—Pleasant Suburb.—Old-established PRACTICE, producing over £500 p.a., including panel of 417. Visits 3/6 to 5/-. Little midwifery. Eight-roomed house, with fair-sized garden. Rent £60. Premium £500.
23. HOME COUNTY.—Within 40 miles of London.—In small Village (with large surrounding population) in pleasant district, old-established mixed and increasing PRACTICE, worth last year nearly £3,600, including Union and Vaccination over £100, and panel producing over £1,150. Railway station in place. House contains surgery and waiting rooms (separate entrance), 2 reception, 4 bedrooms, bathroom, etc., large garden. Gas, electric light available. Price for freehold £2,500, part mortgage. Premium 1½ years' purchase. Good society, sport, etc. Vendor keeps an Assistant, but investment would admirably admit of taking a partner later on, as houses available.
24. WITHIN ONE HOUR OF LONDON (good train service).—Old-established mixed-class PRACTICE, offering good scope. Average income about £600. Fees 2/6 to 7/6. Not much midwifery. Easily worked. Semi-detached house in good condition, with 2 reception, 5 bedrooms, etc. Surgery and waiting room. Garden. Rent on lease £65 p.a. Premium 1½ years' purchase, or near offer.
25. CHANNEL [illegible] eneral PRACTICE. Present income appr[illegible] scope. Advice and medicine 3/6 to 10/ [illegible] to 15/-. Midwifery refused. Commodious [illegible] 6 bedrooms, etc. Vendor's freehold. Good schools. Price for practice and house £3,000.
26. GLOUCESTERSHIRE.—Very old-established unopposed Country PRACTICE, held by Vendor for the past ten years, and situated in attractive district, near good town. Cash receipts for 1928, £656, and this year at the rate of £700. Panel of over 500. Fees 2/6 to 12/6. Commodious house, with 6 bedrooms, etc. One acre of garden and paddock. Price for freehold £1,200. Sport of all kinds. Premium £900.

Full Schedule of Terms and Conditions will be forwarded on application.

The Haemorrhoidal Circle



Internal and external hæmorrhoids resulting from pressure upon the blood vessels and obstruction of the circulation in the rectum.

DISTENTION of the rectum from painful defæcation—pressure on the rectal blood vessels — impeded circulation — hæmorrhoids. Cathartics to relieve the constipation —irritation of the mucous membrane and the existing hæmorrhoids — pain — possible anal fissure — cessation of purging—constipation.

Such is all too frequently the vicious circle of dyschezia and hæmorrhoids, a combination which requires appropriate local treatment and a bowel corrective that will not irritate.

AGAROL Brand Compound, the original emulsion of mineral oil, agar-agar and phenolphthalein, is pre-eminently indicated for the correction of the vicious circle.

AGAROL Brand Compound lubricates, therefore prevents irritation by friction; it segments and softens the fæcal mass, and thereby prevents possible excessive strain in the expulsion of it; it stimulates the peristaltic force without the shock of cathartics.

A liberal quantity sent to physicians on request.

FRANCIS NEWBERY & SONS, LTD.
31-33, BANNER STREET,
LONDON, E.C.1

Prepared by WILLIAM R. WARNER & CO., INC.
Manufacturing Pharmacists Since 1856

Agarol Brand Compound is the *original* Mineral Oil—Agar-Agar Emulsion (with Phenolphthalein)

ibility; rtificial flavouring; free from sugar, alkalies and alcohol; no oil leakage; no griping or pain; no nausea; not habit forming.

Printed and published by the British Medical Association, at their Office, Tavistock Square, in the Parish of St. Pancras, in the County of Londo

DIET AND CONSTIPATION.

THOUGH in all cases of intestinal atony the diet should be carefully considered, it has recently been pointed out by a distinguished physician attached to our largest hospital that "*in spite of the general belief, not very much can be done by diet in the treatment of constipation; and the patient's mind should be disabused of the idea that there is any particular harm in taking a regular aperient, provided it is of the right kind.*"

It can confidently be claimed that Eno's "Fruit Salt" comes within this category, for it is an aperient which acts solely by retaining water in the bowel—as a result of its increased osmotic density—thus maintaining bulk and adequate pressure, and so promoting peristalsis.

In contradistinction to most aperients, Eno's "*Fruit Salt*" has no irritant or chemical effect on the mucous membrane—and accordingly produces no nausea or discomfort.

"*The Doctor's Emergency Reminder.*"

The Proprietors of Eno's "Fruit Salt" will deem it a privilege to send to any member of the Medical Profession a copy of the latest addition to their series of "Medical Reminders"—with or without a bottle of their preparation (Handy or Household size as required). "THE DOCTOR'S EMERGENCY REMINDER" summarises briefly a few points in connection with the treatment of poisoning and various other emergency cases. It is bound in black morocco limp to conform to the style of the previous publications in this series.

Cutaneous Disorders

Carbuncles Boils, Ulcers

In the treatment of superficial Carbuncles and Boils

especially those of the face, hands and neck, a minimal scar and good function of the involved areas are exceedingly important factors. In these cases, hygroscopic Antiphlogistine offers the physician a therapeutic agent which frequently yields optimum results. In combating a possible infection by the endermic route, the physician will invariably gain the gratitude of the patient, particularly in these cases where, for cosmetic reasons, large incisions are not desirable.

In certain types of Cutaneous Disorders

Antiphlogistine

—embodying the soothing, antiseptic and antipruritic qualities of boric and salicylic acids PLUS the nutritional and antifermentative properties of c.p. glycerin—will be found of definite therapeutic value.

In Indolent Ulcers

not due to specific pathogenic organisms, Antiphlogistine's hyperemic action will dilate the capillaries, bring more blood to the area, stimulate local circulation, promote tissue nutrition and hasten the absorption of assimilable exudate.

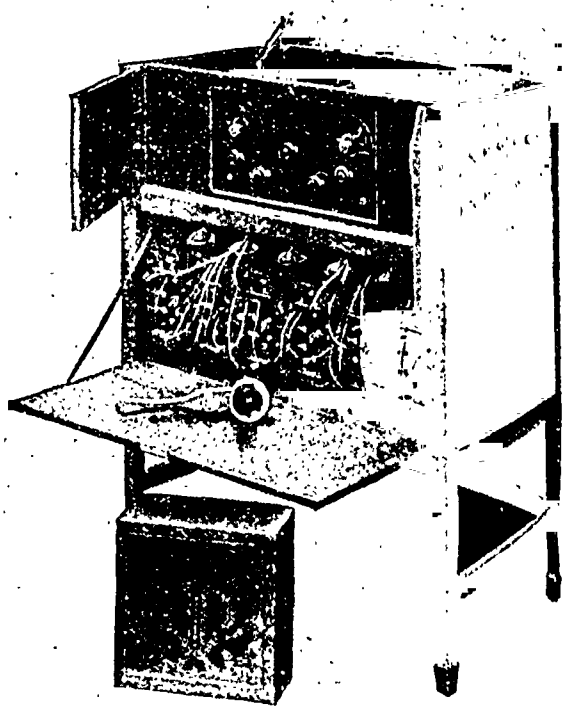
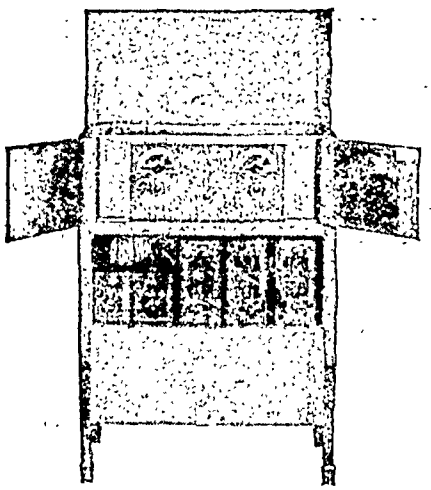
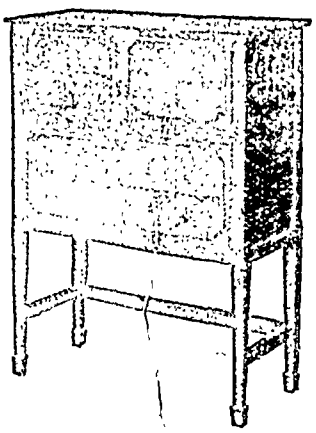
An Ideal Radio Installation for Hospital Entertainment



The Lodge Moor Hospital 9-Valve installation open, showing compact arrangement of eliminators, controls, etc.



Front View of a 6-Valve Met-Vick Hospital Set.



Met-Vick Hospital Set closed, showing attractive, substantial cabinet.

The above illustration shows the Met-Vick Set supplied to the Lodge Moor Hospital, Sheffield. It is capable of operating 40 loud speakers, and 450 pairs of headphones, and is operated direct from the electric light mains.

Met-Vick Hospital Sets can be supplied for operation of any number of loud speakers and phone points with controls which enable the complete installation to be started up or shut down, or alternatively, individual sections may be controlled without interference with the rest of the installation.

There is no trouble from Batteries or Accumulators, all current being supplied direct from the Mains through Met-Vick L.T., H.T. and G.B. eliminators. Low cost of operation, minimum amount of attention, together with reliability and safety, make a Met-Vick Hospital Set, an ideal installation for any institution.

CROSSLEY & SUN

The new 15.7 Sportsman's Coupé

"Occasional Five"
£495

Coachbuilt de Luxe ... £575
Standard Coachbuilt £498

Here is the doctor's Crossley—a very smart "Occasional Five" with black fabric body, red wheels, and red waistline mouldings.

Thanks to the "Sunshine" Roof, which can be opened or shut from the driving seat in less than a minute, you can make the best of all varieties of weather. The unusual width of the body (54¾ inches) gives ample room for three people in front, besides the brace of "occasionals" you may be carrying at the back.

By an ingenious contrivance the luggage trunks fitted at the rear can be opened from the *inside* of the car as well as from the outside. The front screen is of safety glass, there are many other refinements, and the car moves with all the sinuous power of the 15.7 Crossley Six.

HEALTHY HEATING

Do you know that in the area of one gas company alone—

5,340 Doctors
512 Nursing Homes
204 Hospitals

—use gas fires?

So do *90 per cent.* of the maternity centres, dispensaries for tuberculosis, schools for mothers, day nurseries, clinics and crèches in the area of the same company.

Is not this striking proof of the fact that the gas fire is the most hygienic form of heating?

It is hygienic because it ventilates. The gas fire changes the air in a room imperceptibly, without draught or unwanted variation of temperature.

It is hygienic because it can be instantly and accurately regulated to achieve any desired temperature.

It is hygienic because it creates no dirt or ashes to befoul the room, and no smoke to pollute the atmosphere and so keep out the sunlight.

Toxæmias of Pregnancy

BIOCHEMISTRY and Endocrinology prove beyond dispute that pregnant women are weakened in their defences against general disease and septic invasions.

A lowered resistance, often accentuated by the modified shock of parturition, makes PUERPERAL SEPSIS only too simple a matter in many cases, in spite of faultless obstetric technique.

The toxæmias of pregnancy have been investigated and illuminated extensively in the past ten years by the patient research of many brilliant observers, who are all emphatic in representing the importance of intestinal toxæmia in the puerperal picture. Their conclusions point to the necessity of providing

A Safe Intestinal Bactericide

to promote the well-being of mother and child by limitation of putrefactive changes in the bowel during the later months of gestation, and until the post-puerperal period is passed. Such a product is now readily available in the form of Dimol, which, for over eight years, has been giving most gratifying results in the treatment of putrefactive and other bacterial invasions of the intestinal tract, including many cases as here suggested.

THE EFFICIENCY of Dimol in the treatment of many other intestinal conditions of bacterial origin is conclusively told in the interesting clinical reports which, together with a brochure dealing with the pathological significance of the intestinal toxæmias, will be sent to any physician on application to the

Prescribed in numerous cases *of* ***nervous and heart disorders, also rheumatic conditions,*** *etc.*

The active substances of the extracts from cone-bearing pine trees (Pinus silvestris, Abies alba, Pinus montana) is found in an oily substance commonly known as pine oil.

Novopine Sparkling Pine Bath Tablets contain this oil in a convenient form and an effervescence is introduced to facilitate successful solution in the bath. Their therapeutic value lies in their action on skin, lungs, and heart. For, in addition to the direct action through the pores of the skin, the ozonic aroma given off is automatically inhaled during the taking of a hot bath.

Besides their general cleansing and health-giving properties, they have been found especially beneficial as a remedy against nervous heart diseases and kindred disorders.

Samples on request from Natural Products Ltd., 40, Furnival Street, E.C.4.

Local Anæsthesia in Surgical Practice

REMOVAL OF CARBUNCLE

Typical Case.

P. C., aged 45 years, physician (object strenuously to taking General Anæsthesia).

Diagnosis: Carbuncle of neck.

Operation: Excision.

Anæsthesia: Infiltration block, using 60 c.c. of 0.5 of 1 per cent. Novocain-Adrenaline solution.

Operation: The infiltrating needle was carried 5 cm. beyond the outer edge of the carbuncle until the latter had been completely isolated from its nerve supply, when it was removed, absolutely without pain to the patient. The base was then cauterized and packed. The wound healed kindly.

—Extract from PRACTICAL LOCAL ANÆSTHESIA (Farr).

(Full technique of this and one hundred other operations under Local Anæsthesia will be found in the above work published by Henry Kimpton, 263, High Holborn, London, W.C.1.)

THE SAFEST LOCAL ANÆSTHETIC.

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals. Specify " Novocain " for your next operation.

R AND C

Specially indicated in

NEPHRITIS - URÆMIA - ECLAMPSIA - ALBUMINURIA

and allied conditions.

PROMPT and proper diagnosis of kidney conditions is necessary in cases of Bright's disease and all types of renal disorders. In nine cases out of ten the administration of a specific capable of producing real results in compensating for the loss of kidney function is also necessary.

For more than a quarter of a century Nephritin has been a sheet anchor to physicians in treating such disorders. Nephritin Tablets induce a marked increase in nitrogenous waste elimination. They reactivate the cells of the kidney, increase urinary secretion, and induce a greater output of urea.

Given in sufficient dosage these tablets produce marked results, and restoration to normal is quickly stimulated. They are invaluable also as a prophylactic in renal complications of infectious diseases and during pregnancy. The tablets are composed of the hormones of the normal kidney as they appear in nature—*absolutely unaltered.*

BRAND'S ESSENCE OF BEEF for INVALIDS

has enjoyed the confidence of the medical profession for over 90 years. A nourishing stimulant that demands the least amount of energy in the process of assimilation and increases the means of defence by raising the powers of resistance.

Mark it in your memo book

Brand's Essences are scientifically prepared, in jelly form, from the finest English meats, and contain upwards of eleven per cent. of proteid. The nourishing and stimulating properties are IMMEDIATELY ABSORBED, without residue, in the alimentary canal. No time is lost in process of assimilation. No work entailed by the digestive organs. Absolutely pure. Contains no gelatine, colouring, or preservatives. Good for young and old alike.

BRAND'S ESSENCE OF CHICKEN contains the same nourishing and stimulating properties as Brand's Essence of Beef, and for over 90 years has been recommended by the medical profession when required by prevailing conditions.

Sold by Chemists Everywhere.

Coated Tongue and Toxemia

Coating on the tongue consists of epithelial cells, molds, yeast, and many bacteria, some highly virulent. Normally the saliva prevents growth of the latter. If the resistance of the blood is lowered, the saliva loses its germ-destroying and inhibiting power. A tongue coating appears.

In the constipated colon, putrefactive bacteria produce highly active poisons such as skatol, indol, etc. These enter the blood, lower its resistance, and thus weaken all fluid secretions such as the saliva. No wonder 85 per cent. of all sick people have coated tongues. Constipation is almost universal among the sick.

If the tongue indicates toxemia, prescribe Nujol—the safe and effective treatment. Many intestinal toxins are themselves absorbed by Nujol.

Nujol

REGISTERED TRADE MARK

Once absorbed by Nujol, intestinal toxins cannot be absorbed by the system, as Nujol itself is non-absorbable.

Kalzana promotes Calcium Retention

The value of Kalzana tablets lies in their combination of calcium lactate and sodium lactate. In the body the sodium lactate becomes converted into sodium carbonate and imparts the requisite alkalescence to the blood which is necessary to ensure calcium retention. The reports of eminent physicians show that Kalzana possesses all the advantages which one may expect from a calcium preparation.

"The Practitioner" says:

"Kalzana acts efficiently in promoting the growth of strong bones and healthy teeth, in protecting the expectant and nursing mother against a dangerous loss of calcium . . . . particularly because Kalzana promotes calcium retention."

Dispensed by Chemists in air-tight packets containing 50 and 100 tablets.

Kalzana

OVALTINE

MILK AND ITS DEFICIENCIES.

In the dietary of fevers and infectious diseases milk probably holds the most important position for one reason, that it leaves a residue which is not mechanically irritating.

Milk, however, has certain objections. It is deficient in carbohydrate; it is also repugnant to many people and rapidly becomes tiresome to others.

"Ovaltine" improves milk as a nutritional agent wonderfully. It relieves the monotony of a milk diet. Further, the addition of "Ovaltine" to milk not only makes it more attractive to the taste, but raises the nutritive power and renders the milk twice as digestible—valuable features where dyspepsia is associated with constitut[illegible] in cow's milk and converts the curd into a light, flaky, easily digested coagulum. It also provides nutriment of inestimable value for maintaining adequate nutrition.

"Ovaltine" adjusts the

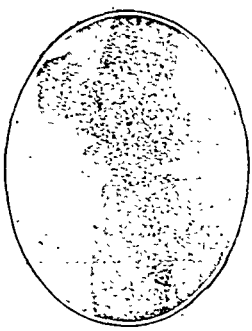
"IODOLYSIN"

Trade Mark.

A Powerful Fibrolytic Agent

Strikingly Successful in Chronic Arthropathies



Radiograph of Knee-joint in Rheumatoid Arthritis

A fibrolytic agent which gives really satisfactory results in a large percentage of cases must appeal to the general practitioner who has constantly to deal with difficult and intractable cases of chronic rheumatism and allied conditions. This can be justly claimed for 'Iodolysin' which has a striking effect in Rheumatoid Arthritis; and it is also employed with advantage for the removal of all forms of pathological fibrous tissue.

'Iodolysin' is a chemical combination of Iodine and Thiosinamin with these special advantages:

Ready Solubility in water. Well tolerated. Absence of local reaction on injection

'Iodolysin' is supplied in ampoules for hypodermic injection; in capsules for oral administration, or as an ointment or paint for local application.

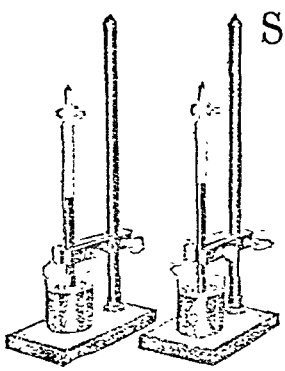
DIOXOGEN

(Trade H_2O_2 Mark)

means

Stable Hydrogen Peroxide



A B

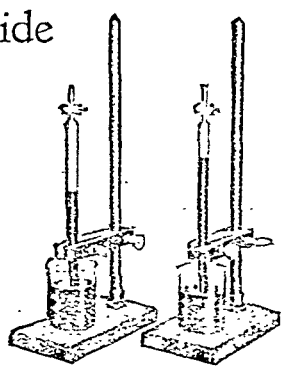
Showing volumes of Oxygen liberated by (A) "Dioxogen," and (B) the same quantity of a fresh sample of ordinary Hydrogen Peroxide (10 volumes).

The merits of nascent oxygen as an antiseptic are too well known to require reiteration. The difficulty lies in obtaining a convenient and reliable source and, while Hydrogen Peroxide is most convenient in use, the unreliability, both in strength and in keeping properties, of the ordinary commercial product seriously limits its utility in practice.

"DIOXOGEN" definitely overcomes this disadvantage. Its stability is remarkable. It can be boiled or frozen without impairment of therapeutic power and, even after being kept for long periods, will yield its full volume of oxygen. This dependability of "Dioxogen" is well exemplified in the accompanying illustrations.

Descriptive literature and a clinical trial sample will be sent post free on application.

Sole Distributors:



A B

Showing volumes of Oxygen liberated by the same quantity of (A) "Dioxogen" and (B) Hydrogen Peroxide (10 volumes), both having been kept for the same period.

ALLEN & HANBURYS Ltd., Bethnal Green, London, E. 2

CATARRH

Its Prevention and Relief

Mistol, applied with a Mistol Dropper in the nose, is extensively prescribed by nose and throat specialists to prevent the recurring attacks of catarrh, and also to aid in the relief of acute paroxysms resulting from this ailment. Being an oily preparation, Mistol diffuses and spreads itself in a thin film over all parts of the mucous membranes of the nose and throat. It clings tenaciously to mucous membranes, and is not easily washed away by the natural secretions. Thus it affords relief in all inflamed and irritated conditions, and assists in warding off infection.

Sold in original sealed cartons containing a—

Mistol
(Registered Trade Mark)

Two-ounce Bottle and Mistol Dropper.

Anæmia in Infancy

During the past year "HEMOLAC" has been used with excellent results in cases of anæmia in infants. This new preparation results from the fact that the addition of Iron Ammonium Citrate to a basis of Cow and Gate Milk Food is often a highly beneficial form of treatment.

HEMOLAC

Full Cream Dried Milk with Iron Ammonium Citrate

"HEMOLAC" is therefore placed before the Medical Profession that they may observe personally its effect in this department of modern practice. Conveniently packed for private practice, also for Welfare Centres, and supplied direct on application. Professional enquiries, as to this and our other standard products, are cordially welcomed.

The manufacturers will gladly supply Samples and any further information, if required, and wish to remind Members of the Medical Profession that the Cow & Gate Laboratories are always at their disposal for experimental work in connection with Milk Foods.

Contramine

and

Thio-histamine

The value of Contramine in cases of gonorrhœa with chronic complications has led to the recognition of this drug as one of the best means available for combating all types of chronic gonococcal infection.

Contramine is also of remarkable value in cases of rheumatism, arthritis and fibrositis even when not of gonococcal origin.

Contramine is supplied in ampoules which contain the drug in sterile, aqueous, isotonic solution ready for intramuscular injection; it is issued also in pessaries for the treatment of gonorrhœa in women.

Thio-histamine is similar to Contramine in pharmacological and therapeutic effects but is quicker in action. Thio-histamine is for use in acute cases, Contramine being more valuable in chronic conditions.

BOOTS PRODUCTS

Dr. JACOBSON'S SOLUTION

KNOWN AS

"BENZYL-CINNAMIC ESTER"

containing the benzyl and cinnamic radicals characteristic of benzyl-cinnamic ester in the form of benzyl-alcohol and ethyl cinnamate, presented in olive oil

IN THE TREATMENT OF TUBERCULOSIS

This treatment, entirely without danger, is suitable for application by any Medical Practitioner. It has yielded noteworthy results in the treatment of Cutaneous, Pulmonary, and Genito-urinary Tuberculosis, Tuberculous Mucous Membranes, and Tuberculous Lymphatic Glands. 1 c.c. ampoules supplied in boxes of twelve.

Literature and full particulars sent to any Medical Practitioner on application to:

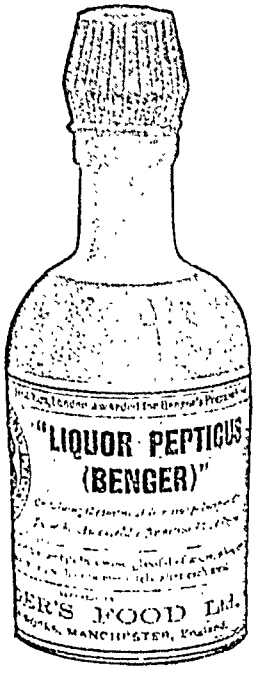
ESSENCE of RENNET
CONCENTRATED (BENGER).
(Curdling Fluid)

Originally prepared at the request of a prominent physician, this highly concentrated essence is of especial value in Infant and Invalid Feeding. As it is concentrated it is much quicker in its effect than most other preparations of Rennet. Whey prepared with Benger's Essence of Rennet is of the greatest value in the treatment of diarrhœa, vomiting, etc.; it can be employed with confidence and will yield good results. Junket can be made more quickly and at a lower cost by using Benger's Essence of Rennet than by any other method.

In 1/- and 1/9 bottles.
Larger sizes for hospitals, etc., use.



LIQUOR PEPTICUS
(BENGER).

"A digestive agent of extraordinary power."
Sir William Roberts, M.D., F.R.S.

Benger's Liquor Pepticus, is a concentrated and highly active fluid pepsin in acid solution which acts particularly upon meat, eggs and other proteid foods.

The best results from the use of Liquor Pepticus are obtained when it is prescribed alone. Should the prescriber wish to combine medicaments of a tonic nature, it will be recollected that those which are free from astringency and alkalinity should be selected.

In 4, 8 and 16-oz. bottles.
Prices: 3/6, 6/6 and 12/6.

COIN-LEGEND AND ROCK INSCRIPTION IN BRĀHMĪ, THE PARENT OF THE MODERN ALPHABETS OF INDIA: EXAMPLES OF THE EARLIEST EXTANT RECORDS OF INDIA.—The multitudinous forms of writing used in India down to the present time can be traced back to one original script—the Brahmi—specimens of which are here illustrated. This was evolved, by Aryan pioneers of civilisation settled in India, from Phœnician characters, such as those seen on the Moabite Stone. These were introduced, probably by Hindu merchants by way of Mesopotamia, about 800 B.C., and were then employed by ancient Indian scholars in writing their own tongue. For this purpose, they evolved from them an alphabetical system to suit the Sanskrit language.

The Brahmi script and its offspring are, therefore, ultimately derived from the same source as our own European characters. While we possess Mesopotamian inscriptions dated to earlier than the third millennium B.C. and Egyptian inscriptions going back perhaps to 5500 B.C., the earliest known among such records in India belongs to the middle of the third century B.C. Nevertheless, there seems no doubt that the art of writing was widely diffused there from about the seventh century B.C., for we learn from Greek sources that the Hindus wrote letters upon some sort of closely-woven tissue—a very perishable material. In addition to Brahmi a script known as Kharoshthi, was used in parts of early India, but it died out leaving no descendants.

Diet in debility

IT has been demonstrated that many cases of illness which manifests itself mainly as debility, associated with headache, constipation, nervousness, and in severe cases recurrent (cyclical) vomiting, are due to Ketosis. This is a condition which is primarily due to disturbance of the function of the liver as a consequence of which digestion and assimilation of fat are markedly retarded or even for the time abolished. If, however, sugar is added to the diet the disease is rapidly cured.

It is evident that when fat is administered to children it should not be in a form that gives rise to derangement of the function of the liver and heart muscle, and that it should be guarded by an adequate quantity of sugar.

In the treatment of debility, apart from a sufficiency of protein, carbohydrates, and fats, a sufficiency of mineral salts, notably calcium and iron, and a well balanced vitamin content are of great importance.

These conditions are admirably fulfilled in Virol, which is composed of Marrow Fat, Glycerine Extract of Red Bone Marrow, Malt Extract, Eggs, Lemon Syrup, with Salts of Lime, Iron, etc., and which has been shown by independent investigations to contain all the vitamins.

The great value of Virol in debility and wasting conditions has been proved in a widespread clinical experience and by its continued use in more than 3,000 Hospitals and Clinics.

An Address on THE WOMAN DAMAGED BY CHILD-BEARING.*

BY

JAMES YOUNG, D.S.O., M.D., F.R.C.S.ED.,

PHYSICIAN, EDINBURGH ROYAL MATERNITY AND SIMPSON MEMORIAL HOSPITAL; GYNAECOLOGIST, ROYAL INFIRMARY, EDINBURGH.

THE subject of this address is the case which we all see frequently—*the woman who has never enjoyed* good health since the *birth* of her children, and, more particularly, since the *birth of her last* child. In such cases the last *pregnancy or birth* is commonly responsible, because, as we know, the *factors* that make for the chronic ill health are frequently *those* factors which, at the same time, make *for infertility*. When a woman gives a history, for example, of one or more pregnancies with a normal spacing in time followed by a lengthened interval of ill health and sterility, the inference is very strong that we are dealing with *some pelvic* damage sustained at the last pregnancy of *the series*. Where this sequence follows the birth of one child we have that *not infrequent* source of marital anxiety, the one-child *marriage*. It is true that in some of these cases there may be some general medical disability—such, for example, as heart or kidney disease; or there may, *of course*, be intentional prevention of pregnancy—*but in the great majority* of cases the source of the ill *health-sterility* complex is to be looked for in a local damage of the pelvic functions.

This morbidity of childbirth is one of the most important problems that face the profession and the community at the present time. It is responsible for much individual, family, and economic distress, and to those of us who are attached to a hospital this army of shattered lives that swell the out-patient attendances and that crowd our already large waiting lists has become a problem of very serious concern. We know that each year in Great Britain about 4,000 women die during pregnancy and in childbed. We have no certain knowledge of the numbers who escape death with their health undermined from the same causes. It is probably understating the case to say that, for every woman who dies, at least ten live with their systems scarred, giving on a moderate estimate about 40,000 annually who pass on to recruit this army of ill health, and who later in many cases fall out by the way from disease whose origins in the fact of childbirth are often very imperfectly or not at all revealed on the death certificate.

In the majority of such cases there is obvious damage of the pelvic organs, and, in general terms, the lesions found fall under one or other of two heads: (1) mechanical, (2) infective. For reasons that are not far to seek we often find that the two types of lesion are combined, for lacerations of the soft structures of the pelvis, which end, it may be, in displacements or cicatricial immobilization of the organs, constitute at the time of birth the most important predisposing cause of infection. It thus happens that in such women some of the symptoms are more properly to be ascribed to an alteration in the statics of the pelvis, whilst other symptoms spring from the superadded infection. At the same time we have to note at the very beginning of our survey that, whilst a purely pelvic pathology may in some instances provide a complete explanation of the impaired health, in many more this is by no means the case. In no class of chronic sufferer is there greater need for the broad outlook in diagnosis than in the woman damaged by child-bearing, for the lesions to which she has been exposed are pre-eminently of that kind that tend to spread their effects into both adjacent and remote parts of the body. A vaginal prolapse, for example, may lead to diseases of the urinary, the gastro-intestinal, and the nervous systems; a cervical infection may not only cause a uterine or tubo-ovarian inflammation or be the factor behind a persisting urinary sepsis, but it may be responsible for chronic rheumatism or even progressive heart disease. Again, chronic ill health dating from childbed may be a compound of pelvic infection and disease of the gall-bladder with gall-stones—a condition in the causation of which child-bearing and its lesions play an important part.

These few examples suffice to point the lesson that to deal successfully with such cases we must cultivate a comprehensive method of approach. There is no class of patient in whom shoddiness of diagnosis and treatment is more disastrously easy, with its attendant disappointment to patient and doctor. Speaking as a gynaecologist and a specialist, whose limited contact with my patients has often made me acutely conscious of the difficulty in pursuing that ideal approach which I am urging, I would earnestly remind my general practitioner listeners of the privileged position they occupy for the study of these problems with that comprehensiveness which they demand. In the hope that I may help to this end I have in this lecture traced the main varied features of the subject, emphasizing those aspects which experience has shown to be most important.

DISPLACEMENTS AS A CAUSE OF GENERAL ILL HEALTH.

The most common *mechanical* lesion is undoubtedly that group of conditions which fall under the general term of *prolapse, and which* are caused by a stretching or tearing beyond a recoverable degree of the lower margins of the levator ani muscles and the connective tissue that bridge across the bony outlet of the pelvis. The lower parts of the levatores ani spring from the pubis in front, and consist of two strong bellies which pass backwards on either side of the bladder and vagina to encircle the rectum. They control the lower end of the bowel, and hold it and the vagina firmly forwards towards the pubis. When their fibres are torn on one or both sides the rectum and anus and posterior vaginal wall fall backwards and downwards, the genital opening gapes, and through it the vaginal walls, with the bladder in front (cystocele) and, less frequently, the rectum behind (rectocele) are forced downwards, with a stretching and dragging on all the surrounding structures of the pelvis. The prolapse of the lower vaginal wall is apt to be followed quickly by a dragging downwards of the womb and tubes and ovaries. Not infrequently an accompanying birth lesion consists of laceration and infection of the cervix, which is then apt to become tightly cicatrized at the vaginal vault; in these circumstances the uterus is able to withstand the intra-abdominal pressure which is the immediate cause of prolapse, and the lesion then consists for a long time only of the vaginal walls and the adjacent viscera (bladder and rectum).

It is unnecessary for me to discuss the ordinary symptoms of prolapse, for these are well known to you all. In the majority of cases the symptoms begin to manifest themselves soon after the occurrence of the damage to the pelvic floor, and they are especially apt to develop early in the woman who has to resume her work before there has been time for an attempt at natural recovery. In many cases, however, the symptoms do not appear for a considerable time, and in such it is not infrequent for the first manifestations to reveal themselves only after the menopause. The typical symptoms are a feeling of "something coming down," a dragging or bearing-down pain in the small of the back and lower abdomen, frequency of micturition and "exertion incontinence" of urine, and constipation. If there has been a tear extending right through the entire thickness of the perineal body and the lower end of the rectum and anus there is, of course, incontinence of the bowel. In such cases, it is true, there often is little or no prolapse, as if the clean-cut laceration of the structures in the mid-line had allowed the easy escape of the child, and had thus saved the levatores ani on either side from being stretched to bursting point.

I would draw your attention specially to certain other common symptoms, which, although springing originally from the pelvic lesion, have little obvious relation with the pelvis. For this reason their significance, or even their existence, is often overlooked, with resulting errors in diagnosis and treatment of grave moment to the patient. Women with prolapse, for example, will tell you that they suffer from a feeling of exhaustion, which increases as the day goes on, and which is especially severe after exertion. This, added to their bladder symptoms, may make ordinary

* Delivered to the Fife Branch of the British Medical Association.

outdoor exercise intolerable. They go to bed overwrought, sleep poorly, and waken up unrefreshed. Their appetite suffers, they become irritable and depressed, and women whose temperament previously had been bright and buoyant may on this score become a source of great annoyance to themselves and their family. These more general symptoms, in which the nervous element is strongly marked, often lead to the poor woman being marked down by her friends and relations, and sometimes even by her doctor, as "suffering from nerves," and this, in its turn, naturally tends to aggravate her symptoms by adding to her troubled mind a further source of worry. My experience of ailing women has long convinced me that in the majority of cases neurasthenia has a physical basis, and that there is no more important contributory cause of this condition than vaginal prolapse. I have seen such women tortured by the attitude of their nearest and dearest, and by their own sense of self-depreciation, and treated by their doctors for functional nervous disorders, the real source of the trouble being meanwhile unrecognized.

Another extremely important point in regard to prolapse is that the longer it is untreated the greater is the risk of the health becoming permanently damaged. In this connexion we have to remember especially that the disturbance of the urinary apparatus may in the course of time lead on to infection of bladder and kidney, and that the constipation caused by the loss of the muscular control of the lower end of the bowel may result in increasing stasis of the intestine with the production of permanent structural changes. Moreover, in course of time the nervous system may become damaged beyond recovery. For all these reasons it is important that prolapse should be treated early.

In many cases the condition can be treated effectively with a pessary, but this must be carefully fitted if it is to be of any use. In slight cases a small ring is sufficient, but in marked cases, and more especially where there is a considerable degree of cystocele, it is better to use a large instrument of oval shape, for at its lower end this forms a shelf for the bladder. By plunging a vulcanite ring for a few seconds into boiling water it can be softened sufficiently to allow of its being compressed to the desired shape. Rubber instruments should never be used, since they quickly corrode, producing crevices and spaces in which the vaginal discharges accumulate and putrefy. On the whole, unless the patient can be trusted to douche the vagina twice or thrice weekly, and to report at intervals of two or three months to have the instrument removed and cleaned, the pessary regime is unsafe, and operative treatment, consisting of a lifting up and a fixation of the bladder at a normal level and a repair of the damaged pelvic floor behind, should be carried out.

The other common class of displacement of the uterus, *retroflexion*, frequently owes its origin to childbirth, especially if there has been any infective complication which has prevented the healthy involution of the uterus and its supporting ligaments. Under these conditions the uterus remains permanently enlarged (subinvolution), and it does not recover its normal position. On the other hand, apart from the sterility or the tendency to abortion which the displacement may cause, the symptoms so commonly associated with retroflexion, such as menorrhagia, dysmenorrhoea, leucorrhoea, and dyspareunia, are usually caused not by the abnormal uterine position, but by the associated chronic infection. For these reasons an operation for the replacement of a retro-deviated uterus is required only on comparatively few occasions. We see many cases in which failure to appreciate these facts has led to operations that bring no relief. Treatment of an infected cervix and curettage for the menorrhagia may be all that is required. Where, on the other hand, the womb is greatly enlarged and forms a tender tumour pressing on the bowel, causing constipation and pain on defaecation, dyspareunia, and pain in the lower abdomen and back, an abdominal operation for replacement and forward fixation is necessary. This at the same time allows of the treatment of the tubal and ovarian disease, which is often present in such cases, and which may be responsible for adhesions that fix the uterus in its backward position. Where the uterus is mobile and can be lifted forward a tentative trial of a pessary enables us to gauge how far the symptoms have been derivable from the retroflexion alone in those cases where otherwise the diagnosis is not quite clear. In this way we get an indication as to how far an operation is likely to be helpful. If the retro-deviation is recognized in the puerperium, reposition of the uterus and the use of a pessary for a few months may be followed by cure of the condition.

STRAINS OF THE SPINAL AND PELVIC JOINTS.

Another common mechanical disability dating from childbirth or child-bearing consists of *strains of one or more of the articulations of the spinal column and pelvis*. These strains are a frequent cause of chronic pain and discomfort, and, as they often remain undiagnosed and untreated, they constitute a fertile source of persisting ill health. The joints apt to be so affected are the sacro-iliac, the lumbo-sacral, the sacro-coccygeal, and the symphysis pubis. Whilst strains of these articulations are by no means uncommon in nulliparous women and in men, where trauma and faulty posture play an important part, there are present during pregnancy and childbirth certain influences which peculiarly tend to their production. The first of these factors is the softening of the ligaments and the increased mobility of the joints found at these times; the second is the marked alteration in the spinal posture which the pregnant woman tends to assume, and the third is the stretching of the ligaments and the excessive movement of the joints which may occur during labour, especially when there is mechanical difficulty arising from undue size of the child or other cause. To these factors must be added such common individual defects as arise from general loss of tone and muscular and structural flabbiness, which lead to an aggravation of the changes resulting from postural or parturient causes, and which, in such women, may easily result in structural alterations.

Sacro-iliac and lumbo-sacral strains are a frequent cause of low back pain, situated over the affected joint or spreading into a broad area of the "small of the back." The pain frequently extends into the iliac fossa and groin, across the buttock and down the back of the thigh. It is present during standing or sitting, and it is unrelieved by lying down, whilst it is aggravated by stooping and by lateral movement of the trunk; these movements may be restricted. There is tenderness on pressure over the affected joint. In sacro-iliac strain pain may be felt in the joint when the thigh is flexed on the abdomen with the knee straight, whilst in lumbo-sacral strain full flexion of the thighs with bent knees causes pain. In severe cases there may be lameness.

It is important to remember that these orthopaedic lesions, by causing pain and discomfort in the back and lower abdomen, may easily lead to an erroneous diagnosis of gynaecological disease, appendicitis, or kidney disease. The confusion in diagnosis is still further increased when, as not infrequently happens, the strained joint is accompanied by disease of the pelvic organs. In the presence of prolapse, for example, which is a common cause of low back pain, the existence of a sacro-iliac or lumbo-sacral strain may easily be overlooked. We have further to recognize the possibility that a gynaecological or abdominal lesion—for example, visceroptosis—by establishing a fault in posture or by inducing a general hypotonus, may be the primary factor behind the strained joint. A recognition of all these facts has led, on the one hand, to the discovery that much of the suffering which has persisted in the past after our plastic operations for prolapse and our abdominal operations for pelvic disease is to be traced to an accompanying and undiagnosed static disorder. On the other hand, it has forced us to the view that treatment of a damaged joint, if it is to be successful, should be accompanied by treatment directed to any associated gynaecological or general abdominal condition.

The treatment of sacro-iliac and lumbo-sacral affections to be effective must be prolonged and carefully supervised, and consists of rest in bed for several weeks in a posture aiming at easing the strained ligaments, the application of hot fomentations over the joint, and, later, the use of prescribed exercises and the provision of a well-fitting brace or belt. In working-class and poor women such lengthy treatment is usually impossible, and we then have

o be satisfied with the support given by strips of adhesive laster extending round the pelvis and placed above the evel of the trochanters, or by the application of a belt. n addition to these measures any local pelvic disease hould be treated and dietetic and hygienic procedures nstituted with the object of increasing the general health. n aggravated cases with dislocation of the joint manipulation under anaesthesia may be required.

The following case is a typical example of unrecognized acro-iliac strain associated with, and probably secondary o, abdominal and gynaecological disease.

A nullipara, aged 43, fifteen years ago (in Canada) underwent emoval of the right and partial removal of the left ovary for evere dysmenorrhoea. Her condition was greatly improved. Four ears ago she was operated on for right inguinal hernia, and two ears ago for gall-stones. For four years she had constant incapaitating low back pain, frequent and painful micturition, and nuch abdominal distress with attacks of recurring pain. The terus was large, retroflexed, and tender. An operation was performed for intraperitoneal shortening of the round ligaments. ollowing this the bladder and abdominal symptoms were relieved, ut the backache was unimproved. Re-examination and *x*-ray hotograph showed faulty posture with marked lumbar lordosis nd tilting back of the sacrum, and evidence of sacro-iliac and umbo-sacral strain on the left side. Manipulation under gas naesthesia was carried out by Mr. Cochrane, and followed by est in a prescribed position and local application of hot fomentaions for two weeks; a brace was fitted to hold the shoulders orwards and the pelvis and lower abdomen back. These measures esulted in a cure of the condition.

Strain of the pubic symphysis during labour is a not infrequent cause of pain over the joint in the early puerperium, ut it has usually passed off by the time the patient is ready o get out of bed. In rare cases the condition may persist, nd in some instances it may cause serious discomfort asting for many weeks or months and necessitating prolonged rest in bed. The treatment consists in immobilization of the joint by adhesive plaster placed in broad strips round the pelvis and worn for some weeks after the patient is allowed to get up. *Strain of the sacro-coccygeal joint* may cause long-persisting pain which is aggravated by sitting, and is especially marked in cases where there has been a backward displacement and fixation of the coccyx in a position which causes its point to project under the skin. The treatment consists in forcible reduction of the displacement and rest in bed till the bone becomes fixed in a normal position. In some cases excision of the coccyx may be necessary.

Before leaving the consideration of the conditions arising from mechanical damage I would refer briefly to a rare lesion of which I have seen only one example—namely, *fracture of the pelvis during labour.*

The patient was a 4-para, aged 36, who since the instrumental birth of a baby weighing 11¼ lb. four years previously had suffered from severe pain in the small of the back and lameness affecting both legs. Since then she had been a cripple, being able to walk only with difficulty and with the aid of two sticks. On *x*-ray examination she was found to have fractures of the transverse and descending rami of the pubis on both sides and a series of fractures of the iliac bones radiating from the sacro-iliac joint on each side. There was, in addition, a severe degree of osteoporosis of the pelvic bones and of the shafts of the long bones; the skull was not involved. The condition was diagnosed as one of defective calcium metabolism with bony absorption due to deficiency diet, and treatment including the administration of cod-liver oil and artificial sunlight was instituted.

I have records of a further case showing marked disturbance of locomotion with a waddling gait in an unmarried girl of 19 years, in whom *x*-ray examination revealed osteoporosis of the pelvic bones. Under a general dietetic regime and the administration of cod-liver oil the condition has returned practically to normal within a few months.

These cases demonstrate the role of deficiency disease in the production of osseous lesions of the pelvis.

Infection of the Pelvic Organs as a Cause of Chronic Ill Health.

Infection dating from childbed may involve any part of the pelvic area, but the most common lesion by far is *infection of the cervix.* It is only within recent years that the importance of this lesion has come to be appreciated. It is recognized by the soft, pulpy feeling, and, on examination with the speculum, by the deep congestion of the mucous membrane surrounding the external os, although the lesion is, of course, more deep-seated. The starting point of the trouble is often an imperfectly healed laceration. Enlargement of the cervix from general congestion and fibrous thickening is common. Blockage of the tubules of the cervical glands leads to distension of the acini by a thick infected mucous secretion to form the so-called Nabothian follicles, which are felt as hard nodules and frequently show on the surface as small raised greyish points. A chronically inflamed cervix often bleeds on being touched, and this, added to the hardening produced by the fibrosis and the Nabothian nodules, may lead to an erroneous diagnosis of cervical cancer.

The cardinal symptom of chronic cervicitis is "whites," and sterility is common. In many cases it may cause little further disturbance of the pelvic functions or of the general health, whilst in others it is a source of much pelvic discomfort and chronic disability. Disease of the cervix *itself* does not cause pain, but cervicitis, by leading to a persisting infection in the surrounding cellular tissue, is one of the most frequent causes of that commonest of all chronic pelvic symptoms—pain in the left iliac fossa. It is also a fertile source of pain in the right side and in the sacral area. The relationship between the cervicitis and the pain in these areas can often be brought out in a striking manner by the simple expedient of putting the corresponding tissues on the stretch. If, for example, the cervix be pushed over to the right side, a left iliac pain caused in this way can be reproduced accurately. So, in chronic utero-sacral cellulitis, a fairly common sequel of cervicitis, by pushing the cervix forwards we immediately elicit the sacral pain and the sense of discomfort often felt by such patients when the bowels move. The fibrosis and cicatricial contraction following these cellulitic deposits may lead to the cervix becoming immobilized and displaced in the direction of the scar.

Infection of the cervix is a further source of trouble in that at any time it may spread upwards into the uterine body, and thence—or perhaps more commonly by extending via the veins or lymphatics—it may involve the tubes and ovaries. Furthermore, as we believe, chronic cervicitis is a common precursor of malignant disease.

For all these reasons cervical infection should always become the object of active treatment, the best method we at present have at our disposal being a thorough opening up of the inflamed areas with the cautery. This allows of drainage of the infected and distended glands and of the pent-up sepsis in the cellular tissue. Thereafter the daily introduction of a tampon containing ichthyol (10 per cent.) in glycerin should be carried out for two or three weeks. To avoid staining of the clothes with the ichthyol a thick diaper should be worn. In severe cases two or three cauterizations at monthly intervals may be necessary. Where there are cervical lacerations these should be repaired. Where the cervix is markedly enlarged from deep-seated infection the best treatment often consists in amputation.

We have next to consider a fairly common group of cases in which the pathology is ill defined, but in which a chronic infective factor seems to predominate. They consist of parous women typically nearing the age of the menopause, although they may be much younger, in whom the dominating symptom is excessive menstrual loss, often with much clotting of the blood, and frequently, in addition, irregularity of the periods and intermenstrual bleeding. Leucorrhoea and dysmenorrhoea are common, and debility and anaemia from the blood loss are frequently present. On examination the cervix is often found to be lacerated and chronically infected and the uterine body to be large and tender. There is no evidence of a fibroid growth in the uterus, and the existence of mucous polypi or malignancy is excluded by curettage. Curettage gives no relief. Largely as a result of this process of exclusion with, in addition, the frequent evidence of an infective element and chronic ill health dating from childbed, these cases are often thrown into the category of chronic inflammation of the uterine body or *chronic metritis.* In some cases the symptoms may in reality spring from ovarian dysfunction. They require active treatment on account of the excessive blood loss, and in many instances this can be effectively and safely carried out by the introduction of 30 mg. of radium into the uterus for four days. This induces an artificial menopause, and has the advantage of obviating

the risks incidental to an operation for removal of the uterus. In the absence of radium, hysterectomy is the only alternative.

Chronic inflammation of the tubes and ovaries dating from childbed infection is a fairly frequent cause of persisting invalidism, revealing itself in iliac fossa premenstrual dysmenorrhœa, chronic lower abdomen pain, sterility, menorrhagia, dyspareunia, and leucorrhœa. It produces tender inflammatory masses felt behind and to the sides of the uterus, which is usually enlarged, immobilized, and often retroflexed. There are general systemic symptoms, such as dyspepsia, headaches, loss of weight, etc. It is important to remember that chronic tubal and ovarian disease frequently follows a puerperal infection so mild in its onset that there may be little or no history of acute symptoms or fever in the puerperium. In such cases the origins of the trouble are to be found in the history which the patient gives that she has never been fit since the last miscarriage or labour. "Acute exacerbations" of the symptoms may occur, although they are not so common in puerperal as in gonococcal salpingitis, where we now recognize that the typical tendency to recurring acute attacks is dependent usually upon reinfection. In some cases the ascending infection may arise primarily in a diseased cervix, and in these a sort of reinfection may continually be going on. In some instances a puerperal infection consists in reality of a pre-existing more or less quiescent gonorrhœa, which flares up as the result of the trauma of labour and the opening up of fresh raw surfaces.
